Plugins Compatibility

- Plugins in Release 3.11 are compatible with AutomationEdge Release 6.0.0 onwards.

Plugins Technical Reference

AutomationEdge Plugins technical reference includes three guides,

- AutomationEdge_R3.11_Plugin_Reference_Guide1
- AutomationEdge_R3.11_Plugin_Reference_Guide2
- AutomationEdge_R3.11_Plugin_Reference_Guide3

Contents

- III. Advanced Workflow Steps..... 21**
- 1 Active Directory 22**
- 1.1 Add to Group 22
- 1.2 Advanced Search 24
- 1.3 Create Account..... 26
- 1.4 Create Group..... 28
- 1.5 Delete Account 30
- 1.6 Delete Group 32
- 1.7 Disable Account 33
- 1.8 Does Group Exists 35
- 1.9 Does User Exists..... 36
- 1.10 Enable Account 38
- 1.11 Get Computers 40
- 1.12 Get Groups..... 41
- 1.13 Get Group Members 44
- 1.14 Get Group Properties 45
- 1.15 Get Organizational Units 47
- 1.16 Get Last Logon Timestamp..... 49
- 1.17 Get Users 50
- 1.18 Get User Groups 53
- 1.19 Get User Properties 54
- 1.20 Is Account Disabled 56
- 1.21 Is Account Locked..... 57
- 1.22 Move Account..... 59
- 1.23 Get Password Expiration Days Left 61
- 1.24 Remove from Group..... 63
- 1.25 Rename Account..... 65
- 1.26 Reset Account Password 67
- 1.27 Set Group Properties 69
- 1.28 Set Password Properties..... 70

1.29	Set User Properties	72
1.30	Unlock Account	74
2	AirWatch.....	76
2.1	AW: Add Enrollment User (Basic)	77
2.2	AW: Add Enrollment User To User Group	79
2.3	AW: Deactivate Enrollment User.....	81
2.4	AW: Remove Enrollment User from User Group	83
3	Amazon EC2.....	85
3.1	Amazon EC2: Attach Volume.....	85
3.2	Amazon EC2: Create Key Pair.....	86
3.3	Amazon EC2: Create Security Group	88
3.4	Amazon EC2: Create Volume	91
3.5	Amazon EC2: Delete Key Pair	94
3.6	Amazon EC2: Delete Volume	95
3.7	Amazon EC2: Detach Volume	97
3.8	Amazon EC2: Get Instance Properties	98
3.9	Amazon EC2: Get Instance Properties By Instance ID	99
3.10	Amazon EC2: Launch Instance.....	100
3.11	Amazon EC2: Reboot Instance.....	102
3.12	Amazon EC2: Start Instance.....	104
3.13	Amazon EC2: Stop Instance	105
3.14	Amazon EC2: Terminate Instance	107
4	Amazon S3	109
4.1	Amazon S3: Add Tag To Bucket.....	109
4.2	Amazon S3: Create Bucket.....	111
4.3	Amazon S3: Create Folder.....	113
4.4	Amazon S3: Delete Bucket	114
4.5	Amazon S3: Delete File	116
4.6	Amazon S3: Download File.....	119
4.7	Amazon S3: Download Folder	121
4.8	Amazon S3: Get Bucket List	123

4.9	Amazon S3: Get Objects From Bucket	124
4.10	Amazon S3: List Versions Of Objects	126
4.11	Amazon S3: Upload Directory	128
4.12	Amazon S3: Upload File	130
5	Ansible.....	133
5.1	Ansible: Run Playbook	133
6	BMC Remedy.....	138
6.1	Get Remedy Record	138
6.2	Insert Remedy Record	140
6.3	Update Remedy Record.....	142
7	BMC Remedy (REST).....	145
7.1	Remedy (REST): Delete Record.....	145
7.2	Remedy (REST): Download Attachment	148
7.3	Remedy (REST): Input.....	150
7.4	Remedy (REST): Insert Record	154
7.5	Remedy (REST): Update Record.....	158
7.6	Remedy (REST): Upload Attachment	161
8	CAPTCHA	163
8.1	DBC: Image.....	164
8.2	DBC: reCAPTCHA v2 Checkbox	165
8.3	DBC: reCAPTCHA v3	168
9	Cherwell.....	170
9.1	Cherwell: Delete Record	171
9.2	Cherwell: Download Attachment.....	173
9.3	Cherwell: Input	176
9.4	Cherwell: Insert Record.....	178
9.5	Cherwell: Update Record	183
9.6	Cherwell: Upload Attachment.....	187
10	Cognibot.....	189
10.1	Cognibot: Send Reply	189

11 Docker	190
11.1 Docker: Commit Container	190
11.2 Docker: Create Container	193
11.3 Docker: Delete Container	196
11.4 Docker: Delete Image	198
11.5 Docker: Inspect Container.....	201
11.6 Docker: List Containers.....	204
11.7 Docker: Start Container.....	208
11.8 Docker: List Images	210
11.9 Docker: Stop Container	214
11.10 Docker: Update Container.....	216
12 DocuSign.....	220
12.1 DocuSign: Add Document In Envelope.....	221
12.2 DocuSign: Add Document In Template.....	223
12.3 DocuSign: Add Field In Document.....	225
12.4 DocuSign: Add Recipient In Envelope	227
12.5 DocuSign: Add Recipient In Template	229
12.6 DocuSign: Create Draft Envelope	232
12.7 DocuSign: Create Draft Envelope Using Template.....	233
12.8 DocuSign: Create Template.....	235
12.9 DocuSign: Delete Documents From Envelope	236
12.10 DocuSign: Delete Recipient From Envelope.....	238
12.11 DocuSign: Download Documents From Envelope.....	239
12.12 DocuSign: Get Documents From Envelope	241
12.13 DocuSign: Get Recipients From Envelope	243
12.14 DocuSign: Send Envelope By Envelope ID	244
13 Dropbox.....	246
13.1 Dropbox: Copy File Or Folder	246
13.2 Dropbox: Create Folder.....	248
13.3 Dropbox: Delete File Or Folder	251
13.4 Dropbox: Download File Or Folder.....	252
13.5 Dropbox: Move File Or Folder.....	254

13.6	Dropbox: Rename File Or Folder	256
13.7	Dropbox: Share File Or Folder	258
13.8	Dropbox: Upload File	261
14	Dynamic 365.....	262
14.1	Dynamics 365: Delete Entity	263
14.2	Dynamics 365: Get Entity Records	265
14.3	Dynamics 365: Insert Entity	267
14.4	Dynamics 365: Update Entity.....	270
15	FreshDesk	274
15.1	FreshDesk: Create Record	274
15.2	FreshDesk: Delete Record.....	276
15.3	FreshDesk: Get Record By ID.....	278
15.4	FreshDesk: Get Records Count	279
15.5	FreshDesk: Get Records.....	281
15.6	FreshDesk: Update Record.....	283
15.7	FreshDesk: Upload Attachment	286
16	Google Drive	287
16.1	Copy File	289
16.2	Create File Or Folder	290
16.3	Delete File Or Folder	292
16.4	Download File.....	293
16.5	Move File Or Folder	295
16.6	Rename File Or Folder.....	297
16.7	Upload File	298
17	Google Sheets.....	300
17.1	Append Row	301
17.2	Copy Sheet.....	303
17.3	Create Sheet	306
17.4	Create Spreadsheet	309
17.5	Delete Sheet.....	311
17.6	Get Sheet ID By Name.....	313

17.7	Read.....	315
18	Google Workspace	318
1.1	Google Workspace: Add Alias To User	319
1.2	Google Workspace: Add Member To Group.....	320
1.3	Google Workspace: Add User.....	322
1.4	Google Workspace: Assign License	326
1.5	Google Workspace: Create Group.....	327
1.6	Google Workspace: Delete Group	329
1.7	Google Workspace: Delete User.....	331
1.8	Google Workspace: Has Member In Group.....	333
1.9	Google Workspace: Remove License.....	335
1.10	Google Workspace: Remove User From Group	337
1.11	Google Workspace: Reset Password	338
1.12	Google Workspace: Update User	340
19	Intune.....	343
19.1	Intune: Delete Device By ID	345
19.2	Intune: Remote Lock Device By ID	346
19.3	Intune: Retire Device By ID.....	347
19.4	Intune: Wipe Device By ID	348
20	Ivanti Service Manager	349
20.1	Ivanti Service Manager: Create Business Object	350
20.2	Ivanti Service Manager: Delete Business Object.....	352
20.3	Ivanti Service Manager: Search.....	354
20.4	Ivanti Service Manager: Update Business Object.....	357
20.5	Ivanti Service Manager: Upload Attachment.....	359
21	Jenkins	361
21.1	Jenkins: Build Job	362
21.2	Jenkins: Delete Build.....	363
21.3	Jenkins: Delete User	364
21.4	Jenkins: Get Builds	365
21.5	Jenkins: Get Console Output	366

21.6	Jenkins: Stop Build.....	368
22	Jira	369
22.1	Jira: Add Comment	369
22.2	Jira: Add Label	371
22.3	Jira: Add User to Group	372
22.4	Jira: Attach File to Issue.....	374
22.5	Jira: Change User Password (Server)	376
22.6	Jira: Create Group.....	377
22.7	Jira: Create Issue	379
22.8	Jira: Create Project	381
22.9	Jira: Delete Issue	384
22.10	Jira: Delete User	385
22.11	Jira: Delete Project.....	387
22.12	Jira: Download Attachments	388
22.13	Jira: Get Issue	390
22.14	Jira: Get Transition	393
22.15	Jira: Link Issues.....	395
22.16	Jira: Perform Transition.....	397
22.17	Jira: Remove Label	398
22.18	Jira: Remove Group	400
22.19	Jira: Remove User from Group	401
22.20	Jira: Update Issue	403
23	Jira Service Desk	405
23.1	Jira Service Desk: Create Customer Request	405
23.2	Jira Service Desk: Update Customer Request	408
24	JumpCloud.....	411
24.1	JumpCloud: Create System User.....	411
24.2	JumpCloud: Create User Group.....	413
24.3	JumpCloud: Delete System User	414
24.4	JumpCloud: Delete User Group	415
25	Linux	417

25.1	Linux: Add User	417
25.2	Linux: Delete User	418
25.3	Linux: Get Disk Utilization	420
25.4	Linux: Get Service Status	421
25.5	Linux: Get Top N Processes	422
25.6	Linux: Kill Process	423
25.7	Linux: Start Service	425
25.8	Linux Stop Service	426
25.9	Linux Restart Service	427
25.10	Linux: Run Linux Commands	429
25.11	Linux: Start Session	430
25.12	Linux: Stop Session	433
26	Machine Learning	434
26.1	Classification Model Builder	436
26.2	Intent Entity Model Builder	447
26.3	Intent Entity Prediction	449
26.4	Prediction	451
26.5	Regression Model Builder	452
26.6	Regression Prediction	460
26.7	Similarity Lite	461
27	ManageEngine SDP	463
27.1	Add Request Worklog	464
27.2	Insert Record	468
27.3	Update Record	473
28	Microsoft Teams	478
28.1	Microsoft Teams: Add Member To Channel	479
28.2	Microsoft Teams: Add Member To Team	481
28.3	Microsoft Teams: Create Channel	483
28.4	Microsoft Teams: List All Teams	485
28.5	Microsoft Teams: List Associated Teams	487
28.6	Microsoft Teams: List Channels	488

28.7	Microsoft Teams: List Channel Members	491
28.8	Microsoft Teams: List Chats.....	493
28.9	Microsoft Teams: List Team Members.....	494
28.10	Microsoft Teams: Remove Member From Channel	496
28.11	Microsoft Teams: Remove Member From Team	498
28.12	Microsoft Teams: Send Message To Channel.....	500
28.13	Microsoft Teams: Send Message To Chat.....	502
29	MongoDB.....	504
29.1	MongoDB: Create Document.....	504
29.2	MongoDB: Delete Documents.....	506
29.3	MongoDB: Get Documents	508
29.4	MongoDB: Update Documents	510
30	MSSQL Server.....	513
30.1	Add Data files or Log files	513
30.2	Assign Server Roles.....	516
30.3	Create Database	517
30.4	Create Login User	519
30.5	Delete Login User	521
30.6	Modify Data files or Log files	522
30.7	Reset Login User Password.....	525
30.8	Shrink Database.....	526
30.9	Shrink Files.....	528
30.10	Start SQL Agent Job	530
30.11	Stop SQL Agent Job	531
30.12	Unlock Login User.....	533
31	MS Word.....	534
31.1	MS Word: Convert To PDF	534
31.2	MS Word: Mail Merge	536
32	MySQLServer	539
32.1	MySQL Server: Create Database	539
32.2	MySQL Server: Create User	540

32.3	MySQL Server: Reset Password	542
32.4	MySQL Server: Unlock User	544
33	OCR.....	545
33.1	OCR: Google Vision	546
33.2	OCR: Tesseract.....	548
34	Office365	551
34.1	Office 365: Add Member to Group	551
34.2	Office 365: Assign License.....	553
34.3	Office 365: Create Event.....	556
34.4	Office 365: Create Office 365 Group	558
34.5	Office 365: Create Security Group	560
34.6	Office 365: Create User	563
34.7	Office 365: Delete Group	566
34.8	Office 365: Delete User	568
34.9	Office 365: Download Email Attachment	569
34.10	Office 365: Email Message Input	572
34.11	Office 365: Get Events	576
34.12	Office 365: Move Email	578
34.13	Office 365: Remove License	580
34.14	Office 365: Remove Member from Group.....	581
34.15	Office 365: Reset Password.....	583
34.16	Office 365: Send Email	586
35	OneDrive.....	589
35.1	Copy File or Folder.....	590
35.2	Create Folder	593
35.3	Delete File Or Folder.....	595
35.4	Download File.....	596
35.5	Move File Or Folder	600
35.6	Rename File Or Folder.....	602
35.7	Upload File	605
36	Oracle	607

36.1	Create User	607
36.2	Delete User	610
36.3	Create Tablespace	611
36.4	Extend Tablespace	614
36.5	Reset User Password	616
36.6	Unlock User	618
37	OTRS.....	619
37.1	OTRS: Create Ticket.....	619
37.2	OTRS: Get Ticket.....	621
37.3	OTRS: Update Ticket	622
38	PDF Utility	624
38.1	Decrypt PDF	624
38.2	Encrypt PDF	625
38.3	Merge Multiple PDFs.....	626
38.4	Merge PDFs	628
38.5	PDF To Image	630
38.6	PDF to Text	632
38.7	Read PDF form	633
38.8	Split PDF	635
39	Salesforce (REST).....	636
39.1	Salesforce (REST): Create Record	637
39.2	Salesforce (REST): Delete Record	639
39.3	Salesforce (REST): Get Records	640
39.4	Salesforce (REST): Update Record	643
40	ServiceNow	645
40.1	Service Now: Create Service Request.....	645
40.2	Service Now: Delete Record	649
40.3	Service Now: Download Attachments.....	651
40.4	Service Now: Input	653
40.5	Service Now: Insert Record	659
40.6	Service Now: Update Record.....	663

40.7	Service Now: Upload Attachment	667
41	SharePoint Online.....	669
41.1	Copy File or Folder.....	669
41.2	Create Document Library or List	671
41.3	Create Folder	672
41.4	Delete Document Library or List.....	674
41.5	Delete File or Folder.....	675
41.6	Delete List Column.....	677
41.7	Delete List Item	678
41.8	Download File.....	680
41.9	Get List Items	682
41.10	Move File or Folder	683
41.11	Rename File or Folder	685
41.12	Upload File	687
42	Smartsheet.....	688
42.1	Smartsheet: Add Columns	689
42.2	Smartsheet: Append Row	690
42.3	Smartsheet: Create Sheet In Folder	692
42.4	Smartsheet: Get Sheet.....	693
42.5	Smartsheet: Update Cell.....	694
43	SolarWinds.....	696
43.1	Get Alerts	697
43.2	Get Nodes	698
43.3	Acknowledge Alerts.....	700
43.4	Execute SWQL Query.....	701
44	TOPdesk.....	703
44.1	TOPdesk: Download Attachments	703
44.2	TOPdesk: Get Incidents	705
44.3	TOPdesk: Upload Attachment.....	707
45	Twilio	709
45.1	Send SMS	710

46	VirusTotal	712
46.1	VirusTotal: Get File Scan Report	712
46.2	VirusTotal: Get URL Scan Report	713
46.3	VirusTotal: Scan File	714
46.4	VirusTotal: Scan URL	715
47	VMWare	716
47.1	VMware: Convert Template to VM	720
47.2	VMware: Convert VM to Template	722
47.3	VMware: Delete Snapshot	724
47.4	VMware: Delete All Snapshots	726
47.5	VMware: Deploy VM from Template	728
47.6	VMware: Get VM Properties	731
47.7	VMware: Increase Hard Disk Size	733
47.8	VMWare: Modify CPU Count	736
47.9	VMWare: Modify CPU Properties	738
47.10	VMWare: Modify Memory Property	741
47.11	VMWare: Modify Memory Size	743
47.12	VMWare: Power off VM	745
47.13	VMWare: Power On VM	747
47.14	VMware: Rename Snapshot	749
47.15	VMware: Revert VM to Snapshot	752
47.16	VMWare: Shutdown VM	755
47.17	VMWare: Suspend VM	757
47.18	VMware: Take VM Snapshot	759
48	Windows	761
48.1	Windows: Get Disk Utilization	764
48.2	Windows: Get Service Status	765
48.3	Windows: Pause Service	766
48.4	Windows: Restart Machine	767
48.5	Windows: Restart Service	768
48.6	Windows: Resume Service	769
48.7	Windows: Run DOS/PowerShell Commands	770

48.8	Windows: Shutdown Machine	771
48.9	Windows: Start DOS / PowerShell Session	772
48.10	Windows: Stop DOS / PowerShell Session	774
48.11	Windows: Start Service	775
48.12	Windows: Stop Service	775
49	Zendesk	776
49.1	Zendesk: Create Ticket	778
49.2	Zendesk: Delete Ticket	782
49.3	Zendesk: Download Attachments	783
49.4	Zendesk: Get Tickets	785
49.5	Zendesk: Get Tickets Count.....	786
49.6	Zendesk: Update Ticket	788
49.7	Zendesk: Upload Attachment.....	790
50	ZohoDesk	791
50.1	Zoho Desk: Create Ticket	791
50.2	Zoho Desk: Delete Ticket.....	793
50.3	Zoho Desk: Download Attachments.....	794
50.4	Zoho Desk: Get Tickets.....	796
50.5	Zoho Desk: Update Ticket.....	797
50.6	Zoho Desk: Upload Attachment	798
IV.	Appendices	800
1	Appendix 1: Error Handling in IT Plugins	801
2	Appendix 2: PowerShell Setup- Active Directory	802
2.1	Prerequisites for Active Directory on client machine.....	802
2.2	Set PowerShell Execution Policy	802
2.3	Updating PowerShell Version	803
2.4	Modules required for Active Directory Plugins:	803
2.5	Install Active Directory Module on Windows Desktop OS	804
2.6	Install ActiveDirectory Module on Windows Server OS	806
3	Appendix 3: PowerShell Setup - Azure AD.....	808

3.1	Pre-requisites for Microsoft Azure use cases:	808
3.2	Check if PowerShell version is 5.1 using below command:.....	808
3.3	Install AzureRM module for Microsoft Azure:.....	809
3.4	Import AzureRM Module using below command:	809
3.5	Azure VM plugins parameters:.....	811
4	Appendix 4: PowerShell Setup - Office 365.....	819
4.1	Pre-requisites for Microsoft Office365 use cases:	819
4.2	Step 1: Check if required module is installed.....	819
4.3	Step 2: Install required software.....	819
4.4	Office 365 App Registration & Permissions in Azure AD.....	820
4.5	Consent for Permission to App	821
5	Appendix 5: Build Criteria Query in SNOW UI.....	822
6	Appendix 6: Power Shell Remote Connection	826
6.1	Description	826
6.2	Parameters.....	826
6.3	Prerequisites	827
7	Appendix 7: Cisco	829
7.1	Connecting to Cisco with SSH	829
7.2	Commands used for Plugins.....	830
7.3	Additional Commands used for Plugins.....	831
8	Appendix 8: Install VMware certificate	832
8.1	Export Certificate.....	832
8.2	Import Certificate to Java Keystore	838
9	Appendix 9: Enrolling devices for MDM in AirWatch	838
9.1	Setup Apple MDM	839
9.2	Enroll Users.....	848
9.3	Enroll Device	853
9.4	Device Dashboard.....	854
10	Appendix 10: Google Refresh Token Generation	855
10.1	Enable APIs.....	855

10.2	Procedure to get a Client ID and Client Secret	857
10.3	Procedure to generate Refresh Token.....	865
10.4	Refresh Token Expiration.....	869
11	Appendix 11: Intune- Generate Client Credentials	869
12	Appendix 12: OneDrive Refresh Token	877
12.1	Register app for OneDrive on Azure AD.....	877
12.2	Generate Refresh Token for OneDrive	882
13	Appendix 13: OneDrive Folder/File Path	885
13.1	Get Folder Path	885
13.2	Get File Path	888
14	Appendix 14: Managed Engine SDP- Generate Auth Token/Refresh Token .	889
14.1	On-Premise	889
14.2	Cloud	890
15	Appendix 15: Office 365 App Registration for Grant Type – Password Grant	892
15.1	Register App.....	892

III. Advanced Workflow Steps

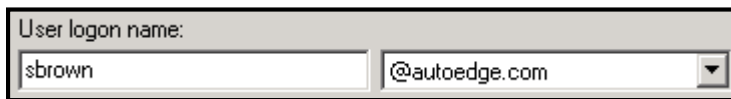

1 Active Directory

Active Directory plugin steps are for the purpose of automating Microsoft Windows Active Directory tasks.

Prerequisites:

1. Privileges to access Active Directory Server.
2. PowerShell version 5 and above.
3. To run AD steps PowerShell setup with Active Directory Modules must be done.
4. Please refer [Appendix 2: PowerShell Setup-Active Directory](#) for updating PowerShell Version and Active Directory module installation.

Note: User Logon Name and User Principal Name:

The screenshot shows a form with the label 'User logon name:'. It contains two input fields. The first field contains the text 'sbrown'. The second field is a dropdown menu with the text '@autoedge.com' and a downward-pointing arrow.

1.1 Add to Group

1.1.1 Description

This step is used to add existing Active Directory Account to an Active Directory Group.

Configurations

Input Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	

5	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	<p>Password is entered using a widget. The widget handles both Text Var (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	<p>Object Type allowed values are: User, Computer, and Group.</p> <p>Note: Double quotes (") and back quote (`) are not to be provided.</p>
2	Object Name	<p>Provide Object name of an existing account in Active Directory to Add to Group, corresponding to the Object Type chosen above.</p> <ul style="list-style-type: none"> • For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). • For object type Computer you may specify Computer Name (CN). • For object type Group you may specify Group Name (CN). • You may specify Distinguished Name or Canonical Name for User, Computer or Group object types. <p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory.</p>

		Note: Object Name(CN) in Active Directory should not contain a slash(/ or \).
3	Group Name	Existing Active Directory Group Name in formats such as Group Name (CN) or Canonical name or Distinguished name to which we intend to add an existing Active Directory object. Note: Group Name(CN) in Active Directory should not contain a slash(/ or \).

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Result	Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". Successful execution shows user has been added to AD group. This field is mandatory.

1.2 Advanced Search

1.2.1 Description

Active Directory: Search Account plugin step provides the list of all Active Directory Users or Groups for the specified Object Type for the Path specified and with Property search criteria provided.

1.2.2 Configurations

Input Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.

4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
6	Password	Specify the password for the username above. Password field appears as Text box and accepts static values or variables. The data type is string. The field is mandatory.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Hover over the field to see Allowed values are: User and Group . The data type is String. This field is mandatory.
2	Path	Provide the path of an Active Directory object for Advanced Search Usually Distinguished name (DN) (e.g. OU=Temp, DC=autoedge, DC=com) or Canonical name (e.g. automationedge.com/Temp) of the object. The data type is String. This field is mandatory.
	Tabular Fields:	At least one Property Name, Search Condition and respective Property Value must be selected in the table fields.
3	Property Name	Double click to select Property Names form the pop up window. The data type is String. This field is mandatory. This field is mandatory.
4	Search Condition	Select a Search Condition from the dropdown list. Following are the values in the list. The data type is String. This field is mandatory. <ul style="list-style-type: none"> • Starts with • Ends with • Is (exactly) • Is not • Present

		<ul style="list-style-type: none"> • Not Present
5	Property Value	Provide a desired property value. The data type is String. This field is mandatory.

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Name	Specify an output field to hold the result- Name upon successful plugin execution. The default label value for this field is "Name". This field is mandatory.
2	Distinguished Name	Specify an output field to hold the result: Distinguished Name on the successful plugin execution. The default label value for this field is "DistinguishedName". This field is mandatory. Note: Advance Search returns Name and Distinguished Name as output. In case you need to use the output of Advanced Search but additionally need User Logon Name then you need to use Get User Properties step after Advanced Search in the workflow to get the User Principal Name by providing DN as input. (e.g. Suppose you want to know Does User Exist/ Is Account Locked for all the users returned in Advanced Search, you need User Principal Name to input DoesUserExist/IsAccountLocked steps. Get User Properties step after Principal Name can fetch the User Principal Name).

1.3 Create Account

1.3.1 Description

Active Directory: Create Account Plugin step is used to create a new Active Directory user.

1.3.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.

	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget called SecuredComboVar. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	First name	First name of the user account to be created. This field is mandatory.
2	Last name	Last name of the user account to be created. This field is mandatory.

3	Full name	Full name of the user account to be created. This field is mandatory.
4	User logon name	Provide User logon name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) for the new account to be created. User Logon Name is mandatory.
5	User logon password	Provide a password for the user Account to be created.
6	Path	Provide path of Active Directory object (usually DN, For e.g. OU=Temp, DC=autoedge,DC=com) where the User Account is to be created. This field is mandatory.

Note:

The account is created if the password fails for any reason. If you provide a password, an attempt will be made to set that password however, this can fail due to password policy restrictions. The user account will still be created and you may use Reset Account Password to set the password on that account. In order to ensure that accounts remain secure, user accounts will never be enabled unless a valid password is set or Password Not Required is set in AD.

Output Tab:

No.	Field Name	Description
1	Result	Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". Successful execution shows user account has been created. Result label value is mandatory.

1.4 Create Group

1.4.1 Description

Active Directory: Create Group Plugin step is used to create a new Active Directory Group.

1.4.2 Configurations

Configuration:

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.

	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	Password is entered using a widget called SecuredComboVar. The widget handles both Text Var (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
6	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed as field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Group name	Provide an AD Group Name. The Group name must be unique in the active directory domain. This field is mandatory.

2	Group Scope	Allowed values for Group scope are: 0, 1, 2 or Domain local, Global, Universal. This field is mandatory.
3	Group Display Name	Provide a display name of the Group. This field is mandatory.
4	Group Category	Group category allowed values are: 0, 1, or Distribution, Security. This field is mandatory.
6	Path	Provide the path of Active Directory object where the Group is to be created - usually Distinguished Name (DN) (e.g. OU=Temp, DC=autoedge, DC=com) or Canonical Name (e.g. automationedge.com/Temp). This field is mandatory.

Output Tab:

No.	Field Name	Description
1	Result	Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". Successful execution shows user group has been created. Result label value is mandatory.

1.5 Delete Account

1.5.1 Description

Active Directory: Delete Account step is deletes an Active Directory User Account.

1.5.2 Configurations

Input Tab:

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.

4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text Var (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	User Logon Name	Provide User logon name (e.g. sbrown, scott.brown etc.) or User Principal Name of an existing Active Directory user account (e.g. sbrown@autoedge.com) that is to be deleted. You may also provide the Name (CN)/Distinguished Name/Canonical Name of an Active Directory user account to be deleted. The data type is String. User Logon Name is mandatory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \)

Output Tab:		
No.	Field Name	Description

	Output Field:	
1	Result	Output field to hold the result of the successful plugin execution. Default label value for this field is “Result”. Successful execution shows user account has been deleted. Result label value is mandatory.

1.6 Delete Group

1.6.1 Description

Active Directory: Delete Group plugin step deletes an existing Active Directory Group.

1.6.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox

		above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Group Name	Specify the Group Name (CN)/Distinguished Name/Canonical Name in active directory to be deleted. This field is mandatory. Canonical name\Distinguished Name may be provided in the group name field to avoid duplicate group name errors. Group Name(CN) in Active Directory should not contain a slash(/ or \).

Output Tab:		
No.	Field Name	Description
1	Result	Output field to hold the result of the successful plugin execution. The default value of this field is "Result". This field is mandatory.

1.7 Disable Account

1.7.1 Description

Active Directory: Disable Account Plugin step disables a user or computer account.

1.7.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.

	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as a Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Object Type allowed values are: User, Computer . Note: Double quotes (") and back quote (`) are not to be provided.
2	Object Name	Provide an existing Active Directory object name (user or computer name) which we intend to disable.

	<ul style="list-style-type: none"> • For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). • For object type Computer you may specify Computer Name (CN). • You may specify Distinguished Name or Canonical Name for both User and Computer object type. <p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
--	---

1.8 Does Group Exists

1.8.1 Description

This plugin checks the current status of an existing Active Directory Group.

1.8.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	

5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	<p>Password is entered using a widget called SecuredComboVar. The widget handles both Text Var (static value or environment variable) and Combo (drop down containing values from previous steps).</p> <p>This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Group name	<p>Provide Active Directory Group name (CN i.e. Common Name) or Canonical name or Distinguished name to check if it exists. This field is mandatory.</p> <p>Note: Group Name(CN) in Active Directory should not contain a slash(/ or \).</p>

Output Tab:		
No.	Field Name	Description
1	Result	<p>Output field to hold the result of the successful plugin execution. Default label value for this field is "Result".</p> <p>Successful execution shows whether group exists or does not exist.</p> <p>Result label value is mandatory.</p>

1.9 Does User Exists

1.9.1 Description

The step is used to check the status of an Active Directory user if it exists or does not exist.

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

1.9.2 Configurations

Input Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	

1	User Logon Name	<p>Provide User logon name (e.g. sbrown, scott.brown etc.) or User Principal Name of an existing Active Directory user account (e.g. sbrown@autoedge.com) to check if user exists. You may also provide the Name (CN)/Distinguished Name/Canonical Name of an Active Directory user account to be deleted.</p> <p>The data type is String. User Logon Name is mandatory.</p> <p>Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
---	-----------------	--

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Result	<p>Output field to hold the result of the successful plugin execution. Default label value for this field is "Result".</p> <p>Successful execution shows user exists. Result label value is mandatory.</p>

1.10 Enable Account

1.10.1 Description

Active Directory: Enable Account step is used to enable a disabled user or computer account.

1.10.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.

4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Object Type allowed values are: User, Computer . The data type is String. This field is mandatory. Note: Double quotes (") or back quote (`) are not to be provided.
2	Object Name	Specify the name of an existing Active Directory object to be enabled, corresponding to the Object Type chosen above. <ul style="list-style-type: none"> For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). For object type Computer you may specify Computer Name (CN). You may specify Distinguished Name or Canonical Name for User, Computer or Group object types.

		<p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: Object Name(CN) in Active Directory should not contain a slash(/ or \).</p>
--	--	---

1.11 Get Computers

1.11.1 Description

Active Directory: Get Computers plugin step provides the list of all active directory computers on a specified path for the hierarchical scope specified.

This is a row generating step and hence has to be the first step in a workflow.

1.11.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
6	Password	Specify the password for the username above. Password field appears as Text box and accepts static values or variables. The data type is string. The field is mandatory.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:										
No.	Field Name	Description								
	Input Fields:									
1	Path	<p>Provide path of Active Directory usually Distinguished Name (DN) (e.g. OU=Temp, DC=autoedge, DC=com or) or Canonical Name (e.g. e.g. automationedge.com/Temp) for which we want to get all the Computers. The Data type is String. This field is mandatory.</p>								
2	Search Scope	<p>Mouse hover on this element to see the allowed values 'Base', 'OneLevel', 'SubTree', OR '0', '1', '2'. The Data type is String. This field is mandatory.</p> <p>Specifies the scope of an Active Directory search. The acceptable values for this parameter are as shown in the table below:</p> <table border="1" data-bbox="643 856 1474 1276"> <thead> <tr> <th>Level</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Base or 0</td> <td>Base or 0 searches only the current path or object.</td> </tr> <tr> <td>OneLevel or 1</td> <td>OneLevel or 1 searches the immediate children of that path or object.</td> </tr> <tr> <td>SubTree or 2</td> <td>Subtree or 2 searches the current path or object and all children of that path or object.</td> </tr> </tbody> </table>	Level	Description	Base or 0	Base or 0 searches only the current path or object.	OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object.	SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.
Level	Description									
Base or 0	Base or 0 searches only the current path or object.									
OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object.									
SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.									

Output Tab:		
No.	Field Name	Description
1	Computers	Specify an output field to hold the Computer Name on the successful plugin execution. The default value for this field is "Computers".
2	Distinguished Name	Specify an output field to hold the Distinguished Name of a computer on the successful plugin execution. The default value for this field is "DistinguishedName".

1.12 Get Groups

1.12.1 Description

© 2023 AutomationEdge Inc All Rights Reserved.
This document is for your company's internal use only and may not be distributed to any third party.

Active Directory: Get Groups plugin step provides the list of all active directory groups on a specified path.

This is a row generating step and hence has to be the first step in a workflow.

1.12.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
5	Password	Specify the password for the username above. Password field appears as Text box and accepts static values or variables. The data type is string. The field is mandatory.
6	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Path	Specify an Active Directory Path (Canonical name or Distinguished Name of an object) for which we wish to get all Groups.

		<ul style="list-style-type: none"> • Canonical Name can be viewed under Properties (while Advanced Featured are enabled in View menu) under Object • Distinguished Name can be viewed under Properties (while Advanced Features are enabled in View menu) under Attribute Editor. <p>Path data type is String. Path is mandatory. Note: Double quotes (") and back quote (`) are not required as part of input.</p>								
2	Search Scope	<p>Mouse hover on this element to see the allowed values 'Base', 'OneLevel', 'SubTree', OR '0', '1', '2'.</p> <p>Specifies the scope of an Active Directory search. The acceptable values for this parameter are as shown in the table below:</p> <table border="1"> <thead> <tr> <th>Level</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Base or 0</td> <td>Base or 0 searches only the current path or object.</td> </tr> <tr> <td>OneLevel or 1</td> <td>OneLevel or 1 searches the immediate children of that path or object and excludes the base object itself.</td> </tr> <tr> <td>SubTree or 2</td> <td>Subtree or 2 searches the current path or object and all children of that path or object.</td> </tr> </tbody> </table> <p>Search Scope data type is String. It is mandatory. Note: Double quotes (") and back quote (`) are not required as input.</p>	Level	Description	Base or 0	Base or 0 searches only the current path or object.	OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object and excludes the base object itself.	SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.
Level	Description									
Base or 0	Base or 0 searches only the current path or object.									
OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object and excludes the base object itself.									
SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.									

Output Tab:

No.	Field Name	Description
1	Groups	Specify an output field to hold the result of the successful plugin execution. Default label value for this field is "Groups". Result label value is mandatory.
2	Distinguished Name	Specify a field name to store the Distinguished Names of the Groups retrieved. The default value is "Distinguished Name".

	Result label value is mandatory.
--	----------------------------------

1.13 Get Group Members

Active Directory: Get Group Members plugin step gets the list of all members present in the Active Directory group.

Limitations:

- On execution, the step can fetch a maximum of 5000 members.
- You cannot fetch Group Member of type **Contact** using the step.

1.13.1 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname / Server Name / IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide the name (SAM Account Name) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as a Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not.

		For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.
--	--	---

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Group Name	Provide name of the group of an existing active directory group.

Output Tab:

No.	Field Name	Description
	Output Fields:	
1	Distinguished Name	Specify a name to store the Distinguished Name of the retrieved members. Default value: Distinguished Name
2	Member Type	Specify a name to store the retrieved member types. Default value: MemberType.

1.14 Get Group Properties

1.14.1 Description

Active Directory: Get Group Properties plugin step gets the properties of an Active Directory Group.

1.14.2 Configurations

Configuration:

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.

3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as a Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Group Name	Specify an Active Directory Group Name (CN)\Canonical Name\Distinguished Name to get the Group properties. Canonical name\Distinguished Name may be provided to the group name field to avoid duplicate group name errors. Note: Group Name(CN) in Active Directory should not contain a slash(/ or \).

Output Tab:		
No.	Field Name	Description

	Output Fields Tabular:	
1	Property Name	Double click to get a list of Group property names. At least one property name should be selected.
2	Output Field	Specify a field name to store the retrieved property values of the corresponding property names.

1.15 Get Organizational Units

1.15.1 Description

Active Directory: Get Organizational Units plugin step gets the list of active organizational units for a specified path. It is a row generating step and hence has to be the first step in a workflow.

1.15.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
5	Password	Specify the password for the username above. Password field appears as Text box and accepts static values or variables. The data type is string. The field is mandatory.
6	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:

© 2023 AutomationEdge Inc All Rights Reserved.

It is mandatory. Note: Double quotes (") and back quote (`) are not required as input.</p>	Level	Description	Base or 0	Base or 0 searches only the current path or object.	OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object and excludes the base object itself.	SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.
Level	Description									
Base or 0	Base or 0 searches only the current path or object.									
OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object and excludes the base object itself.									
SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.									

Output Tab:

No.	Field Name	Description
-----	------------	-------------

1	OU Name	Specify a field name to store the OU names retrieved. The default value is "OU Name".
2	Distinguished Name	Specify a field name to store the Distinguished Names of the OU names retrieved. The default value is "Distinguished Name".

1.16 Get Last Logon Timestamp

1.16.1 Description

Active Directory: Get Last Logon Timestamp plugin step gets the last logon timestamp of an Active Directory user or computer.

1.16.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of the machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as a Text box and accepts static values or variables. Else if checkbox

		above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Specify Object Type - allowed values are: User and Computer . The data type is String. This field is mandatory. Note: Double quotes (") and back quote (`) are not to be provided.
2	Object Name	Specify an existing Active Directory object name for which we wish to get the last logged in timestamp. <ul style="list-style-type: none"> For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). For object type Computer you may specify Computer Name (CN). You may specify Distinguished Name or Canonical Name for both User and Computer object type. The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).

Output Tab:		
No.	Field Name	Description
1	Last LogonTimestamp (UTC)	Output field to hold the result of the successful plugin execution. Default value for this field is "LastLogonTimestamp". This field is mandatory.

1.17 Get Users

1.17.1 Description

Active Directory: Get Users step provides the list of all Active Directory users on the Path specified.

It is a row generating step and hence has to be the first step in a workflow.

1.17.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
6	Password	Specify the password for the username above. Password field appears as Text box and accepts static values or variables. The data type is string. The field is mandatory.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Path	Specify an Active Directory Path (Canonical name or Distinguished Name of an object) for which we wish to get all Users.

		<p>Advanced Features must be enabled from View menu to fetch Canonical name or Distinguished Name from the Object Properties.</p> <ul style="list-style-type: none"> • Canonical Name can be viewed in Properties under Object in AD. • Distinguished Name can be viewed in Properties under Attribute Editor tab in AD. <p>Path data type is String. Path is mandatory. Note: Double quotes (") and back quote (`) are not required as part of input.</p>

It is mandatory. Note: Double quotes (") and back quote (`) are not required as input.</p>	Level	Description	Base or 0	Base or 0 searches only the current path or object.	OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object and excludes the base object itself.	SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.
Level	Description									
Base or 0	Base or 0 searches only the current path or object.									
OneLevel or 1	OneLevel or 1 searches the immediate children of that path or object and excludes the base object itself.									
SubTree or 2	Subtree or 2 searches the current path or object and all children of that path or object.									

Output Tab:		
No.	Field Name	Description
1	Users	Specify an output field to hold the result (User Logon Name/User Principal Name) upon successful plugin execution. The default value for this field is "Users".

1.18 Get User Groups

1.18.1 Description

Active Directory: Get User Groups step provides the list of all groups for a specified user.

It is a row generating step and hence has to be the first step in a workflow.

1.18.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
6	Password	Specify the password for the username above. Password field appears as Text box and accepts static values or variables. The data type is string. The field is mandatory.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	User Logon Name	Provide User logon name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) for which you need all the assigned groups.

		You may also provide the User Name (CN)/Distinguished Name/Canonical Name of an Active Directory user account to fetch assigned groups. User Logon Name is mandatory.
--	--	--

Output Tab:		
No.	Field Name	Description
1	User Groups	Output field to hold the result of the successful plugin execution. Default label value for this field is "User Groups". Result label value is mandatory.
2	Distinguished Name	Specify an output field to hold the result:-Distinguished Name on the successful plugin execution. The default label value for this field is "DistinguishedName". This field is mandatory.

1.19 Get User Properties

1.19.1 Description

Active Directory: Get User Properties step gets the properties of an Active Directory user.

1.19.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	

5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	User Logon Name	Provide User logon name (e.g. sbrown, scott.brown etc.) or User Principal name (e.g. sbrown@autoedge.com) of the user for which you wish to fetch User Properties. You may also provide the User Name (CN)/Distinguished Name/Canonical Name of an Active Directory user account to fetch User Properties. The data type is String. User Logon Name is mandatory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).

Output Tab:		
No.	Field Name	Description
	Output Tabular Fields:	At least one Property Name and Respective Output field should be provided.
1	Property Name	On Click, property names associated with the user are retrieved in a list. Select one or more Property Names one by one.
2	Output Field	Specify an output fieldname to hold the value of the corresponding Property Name.

1.20 Is Account Disabled

1.20.1 Description

Active Directory: Is Account Disabled plugin step checks whether the current status of an existing Active Directory account is disabled.

1.20.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Object Type: Allowed values are 'User', 'Computer'. The data Type is String. This field is mandatory.
2	Object Name	Specify an existing Active Directory object name for which you wish check if Account is disabled. <ul style="list-style-type: none"> For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). For object type Computer you may specify Computer Name (CN). You may specify Distinguished Name or Canonical Name for both User and Computer object type. The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).

Output Tab:		
No.	Field Name	Description
1	Result	Specify an output field to hold the result of the plugin execution. Default label value for this field is "Result". Result label value is mandatory. If Account is disabled the Result is true else false.

1.21 Is Account Locked

1.21.1 Description

Active Directory: Is Account Locked plugin checks whether the current status of an existing Active Directory account is locked.

1.21.2 Configurations

Configuration:		
No.	Field Name	Description

1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Specify an Object Type. The allowed values are 'User', 'Computer'. The data type is string. This field is mandatory.

2	Object Name	<p>Specify an existing Active Directory object name for which you wish check if Account is locked.</p> <ul style="list-style-type: none"> For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). For object type Computer you may specify Computer Name (CN). You may specify Distinguished Name or Canonical Name for both User and Computer object type. <p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
---	-------------	---

Output Tab:		
No.	Field Name	Description
1	Result	Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". Result label value is mandatory.

1.22 Move Account

1.22.1 Description

Move Account Plugin step is moves a user from one organization (OU) to another organization in Active Directory.

1.22.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
Configuration:		
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.

3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget called SecuredComboVar. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Specify the Object Type. Allowed values are 'User', 'Computer', 'Group'. The data type is string. This field is mandatory.
2	Object Name	Specify the name of an existing Active Directory object which you wish to move. <ul style="list-style-type: none"> For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN).

		<ul style="list-style-type: none"> For object type Computer you may specify Computer Name (CN). For object type Group you may specify Group Name (CN). You may specify Distinguished Name or Canonical Name for User, Computer or Group object types. <p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
3	Destination Path	<p>Give the object path (usually OU DN) to which you want to move the active directory account This field is mandatory. Specify the Object Destination Path as Distinguished Name Path (usually OU DN - e.g. OU=Temp, DC=autoedge, DC=com) or Canonical Name Path where the user is to be moved (e.g. automationedge.com/Temp).</p>

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Result	<p>Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". Successful execution shows user account has been moved. Result label value is mandatory.</p>

1.23 Get Password Expiration Days Left

1.23.1 Description

Active Directory: Password Expiration Days Left plugin step searches a given Object (User or Computer) and gets password expiration days left.

1.23.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.

	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Specify Object Type - allowed values are: User and Computer . The data type is String. This field is mandatory. Note: Double quotes (") or back quote (`) are not to be provided.
2	Object Name	Specify an existing Active Directory object name for which you get the Password Expiration Days left.

		<ul style="list-style-type: none"> • For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). • For object type Computer you may specify Computer Name (CN). • You may specify Distinguished Name or Canonical Name for both User and Computer object type. <p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
--	--	---

Output Tab:		
No.	Field Name	Description
1	Password Expiration Days Left	Output field to hold the result of the successful plugin execution. Default label value for this field is "PasswordExpirationDaysLeft". Result label value is mandatory.

1.24 Remove from Group

1.24.1 Description

This plugin is used to remove an existing Active Directory account from an existing Active Directory group.

1.24.2 Configurations

Input Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.

4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text Var (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Object Type allowed values are: User, Computer, and Group. Note: Double quotes (") and back quote (`) are not to be provided.
2	Object Name	Provide Object name of an existing account in Active Directory; that you wish to Remove from Group; corresponding to the Object Type chosen above. <ul style="list-style-type: none"> • For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). • For object type Computer you may specify Computer Name (CN). • For object type Group you may specify Group Name (CN).

		<ul style="list-style-type: none"> You may specify Distinguished Name or Canonical Name for User, Computer or Group object types. The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: Object Name(CN) in Active Directory should not contain a slash(/ or \).
3	Group Name	<p>Existing Active Directory Group Name in formats such as Group Name (CN) or Canonical name or Distinguished name from which we intend to remove an existing Active Directory object. This field is mandatory.</p> <p>Note: Group Name(CN) in Active Directory should not contain a slash(/ or \).</p>

Output Tab:

No.	Field Name	Description
	Output Field:	
1	Result	<p>Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". Successful execution shows Account has been removed from Group.</p>

1.25 Rename Account

1.25.1 Description

Active Directory: Rename Account plugin step renames an Active Directory Account.

1.25.2 Configurations

Configuration:

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.

3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Object Type	Object Type allowed values are only "User", "Computer", "Group". The data type is String. This field is mandatory. Note: Double quotes (") and back quote (`) are not to be provided.
2	Object Name	Specify an existing Active Directory object name to be renamed. <ul style="list-style-type: none"> For object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN).

		<ul style="list-style-type: none"> For object type Computer you may specify Computer Name (CN). For object type Group you may specify Group Name (CN). You may specify Distinguished Name or Canonical Name for all User, Computer or Group object types. <p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
3	New Name	Specify a new Name (CN) for the object to be renamed. This field is a String. The field is mandatory.

1.26 Reset Account Password

1.26.1 Description

The step is used to reset password of an existing AD user.

1.26.2 Configurations

Input Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.

6	Password	<p>Password is entered using a widget. The widget handles both Text Var (static value or environment variable) and Combo (drop down containing values from previous steps).</p> <p>This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	User logon name	<p>Provide User logon name (e.g. sbrown, scott.brown etc.) or User Principal Name of an existing Active Directory user account (e.g. sbrown@autoedge.com) to reset password. You may also provide the Name (CN)/Distinguished Name/Canonical Name of an Active Directory user account to be deleted.</p> <p>The data type is String. User Logon Name is mandatory.</p> <p>Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
2	New Password	<p>New password which we intend to set for the above User logon name.</p> <p>This field is mandatory.</p>

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Result	<p>Output field to hold the result of the successful plugin execution. Default label value for this field is "Result".</p> <p>Successful execution shows user password has been reset.</p>

1.27 Set Group Properties

1.27.1 Description

Active Directory: Set properties for an existing group in the Active Directory.

1.27.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the hostname or server name or IP address of machine where Active Directory is hosted. The Data Type is String. This field is mandatory.
3	Port	Provide the port number for Active Directory. Port number must be an integer. Note: Use the internal default port, 389 for Active Directory, if the port number is not provided.
4	Username	Provide user logon name of an Active Directory account to authenticate. The Data Type is String. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Group Name	Specify a Group Name to set properties. The name has to be unique in a single workflow. The Data Type is String. This field is mandatory.
2	Accept fields as JSON	Select the checkbox if you want to provide a JSON in the JSON field.
3	JSON	Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes (""). Provide all the required or mandatory fields and other fields to be inserted as keys in the JSON. This field is mandatory only if the JSON checkbox is selected.
4	Table fields	
	Property Name	Specify the Property Name key, which is used to keep track of the object. The Data Type is String. This field is mandatory.
	Property Value	Specify Property value, which is a value, such as number, simple string, or date associated with a key.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

1.28 Set Password Properties

1.28.1 Description

Active Directory: Set Password Properties plugin step sets password properties for an existing user account in Active Directory.

1.28.2 Configurations

Configuration:

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	<p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	User Logon Name	Specify an existing Active Directory User to set password properties.

		<ul style="list-style-type: none"> For an existing object type User in Active Directory you may specify User logon name (e.g. sbrown, scott.brown etc.), User Principal Name (e.g. sbrown@autoedge.com) or User Name (CN). You may also specify Distinguished Name or Canonical of the User. <p>The data type is string. This field is mandatory. Object Name must be unique in Active Directory. Note: User Name(CN) in Active Directory should not contain a slash(/ or \).</p>
	User Must Change Password At Next Logon	<p>Give the appropriate property value. Allowed values are '0', '1' or 'true', 'false'. The data type is String. This field is mandatory.</p>
3	User Cannot Change Password	<p>Give the appropriate property value. Allowed values are '0', '1' or 'true', 'false'. The data type is String. This field is mandatory.</p>
4	Password Never Expires	<p>Give the appropriate property value. Allowed values are '0', '1' or 'true', 'false'. The data type is String. This field is mandatory.</p>

1.29 Set User Properties

1.29.1 Description

Active Directory: Set properties for an existing user in the Active Directory.

1.29.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the hostname or server name or IP address of machine where Active Directory is hosted. The Data Type is String. This field is mandatory.
3	Port	Provide the port number for Active Directory. Port number must be an integer. Note: Use the internal default port, 389 for Active Directory, if the port number is not provided.

4	Username	Provide user logon name of an Active Directory account to authenticate. The Data Type is String. This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
7	Button: Test Connection	Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	User Logon Name	Provide user logon name (e.g. sbrown, scott.brown etc.) or you may also provide Full User logon name (e.g. sbrown@autoedge.com) of the user account to set user properties. This is field is mandatory.
2	Accept fields as JSON	Select the checkbox if you want to provide a JSON in the JSON field.
3	JSON	Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes ("). Provide all the required or mandatory fields and other fields to be inserted as keys in the JSON. This field is mandatory only if the JSON checkbox is selected.
4	Table fields	
	Property Name	Specify the Property Name key, which is used to keep track of the object.

		The Data Type is String. This field is mandatory.
	Property Value	Specify Property value, which is a value, such as number, simple string, or date associated with a key.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

1.30 Unlock Account

1.30.1 Description

The step is used to unlock AD user account which is locked (i.e. user account gets locked when we enter wrong credentials multiple times).

1.30.2 Configurations

Input Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Configuration:	
2	Server Name	Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of machine where Active Directory is hosted. This field is mandatory.
3	Port	The port number for Active Directory should be provided. If port number is not provided, internally default port for Active Directory is used i.e. 389. Port should be an integer.
4	Username	Provide User Logon Name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an Active Directory account to authenticate. This field is mandatory.

	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	<p>Password is entered using a widget. The widget handles both Text Var (static value or environment variable) and Combo (drop down containing values from previous steps).</p> <p>This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	User logon name	<p>Provide User logon name (e.g. sbrown, scott.brown etc.) or User Principal Name (e.g. sbrown@autoedge.com) of an existing Active Directory account to unlock account.</p> <p>You may also specify Distinguished Name or Canonical of the User Account.</p> <p>The data type is string. User Logon Name is mandatory.</p>

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Result	<p>Output field to hold the result of the successful plugin execution.</p> <p>Default label value for this field is "Result".</p> <p>Successful execution shows user account has been unlocked.</p> <p>Result label value is mandatory.</p>

Known Issues:

© 2023 AutomationEdge Inc All Rights Reserved.
 This document is for your company's internal use only and may not be distributed to any third party.

These known errors are for all AD plugins

- If an invalid environment variable is provided as input to the plugin, then plugin validates it and throws error as “Failed to get <respective field name>”. But when the same workflow is executed through AutomationEdge, error thrown is not identical to the error thrown by process studio.
- When more than one consecutive space character is provided between two non-space characters and submitted as input to the plugin, then plugin receives input as two non-space characters with only one space character between them, instead of original multiple consecutive spaces.

2 AirWatch

AirWatch plugin steps can be used for MDM (Mobile Device Management) in AirWatch. AirWatch plugin is designed to provide your IT department with the ability to quickly enroll users, devices, Apps, Content, Email and Telecom in your enterprise environment, configure and update device settings over-the-air, enforce security policies and compliance, secure mobile access to corporate resources, and remotely lock and wipe managed devices.

Compatibility:

This plugin has been tested with AirWatch- 19.2.0.0(On-Cloud)

Prerequisites:

- AirWatch instance with access details.

Create REST API Keys in AirWatch:

- Reference ‘VMware AirWatch REST API Guide’:
<https://resources.workspaceone.com/view/zv5cgwjrcv972rd6fmml/en>
- **Steps to Create REST API Keys in AirWatch:**
With Admin as account type, you can access all the managed content APIs. To do this navigate to, Groups & Settings > All Settings > System > Advanced > API > REST API, and select Add, to generate an API key for the service and account type as **Admin**.

Enroll Device:

You can enroll Android, Apple, QNX, Chrome OS and Windows OS devices in AirWatch.

The process of enrolling devices for MDM (Mobile Device Management) is discussed in [Appendix 9: Enrolling devices for MDM in AirWatch](#).

Future Enhancement:

- If required, ‘Advance Input’ tab can be introduced to accommodate the additional input parameters.

Known Issues:

- We can create a child Organization Group but cannot create a user under it.

2.1 AW: Add Enrollment User (Basic)**2.1.1 Description**

AW: Add Enrollment User (Basic) plugin step adds an enrollment user in AirWatch and sends an email to the user with enrollment instructions.

2.1.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the AirWatch instance Server URL (e.g. https://cn1106.awmdm.com) or IP address of the AirWatch instance. This field is mandatory.
4	Username	Specify a username to authenticate to the AirWatch instance (e.g. xx.xx@automationedge.com). This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Provide the password of the username to authenticate. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
	API Key:	
5	Accept Values from fields	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as Text box.

6	API Key	<p>API Key is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled API Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled API Key field appears as a drop down to select fields from previous steps.</p> <p>API Key is available in system settings when REST API access is enabled in AirWatch.</p> <p>API Key is needed to integrate VMware Identity Manager with AirWatch.</p> <p>Steps to Create REST API Keys in AirWatch:</p> <p>With Admin as account type, you can access all the managed content APIs. To do this navigate to, Groups & Settings >All Settings > System > Advanced > API > REST API, and select Add, to generate an API key for the service and account type as Admin.</p> <p>Username, Password and API Key for AirWatch instance are validated.</p>
---	---------	--

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	New Username	Specify a desired unique new username of the enrollment user. This field is mandatory.
2	New Password	Specify a desired password of the enrollment user. This field is mandatory.
3	First name	Specify First name of the enrollment user. This field is mandatory.
4	Last name	Specify a Last name of the enrollment user. This field is mandatory.
5	Email	Specify the desired email address of the enrollment user
6	Security Type	Allowed values are '1' for Directory and '2' for Basic as seen on the Tooltip.

Optional Input Tab:
(You may optionally provide values for fields in this tab. Default values will be set if values are not provided explicitly.)

No.	Field Name	Description
1	Organization Group	Specify the unique identification of the Organization Group to be associated with the enrollment user.

		<p>Organization Group is visible on the top of the screen once you login to an AirWatch instance as shown below.</p> 
2	Status	Status is the state of the Enrollment user for activation and deactivation. Allowed values are "True" for creating an Active user, "False" for creating an Inactive user
3	Contact Number	Specify a desired contact number of the enrollment User.
4	Mobile Number	Specify a desired mobile number of the enrollment user.
5	Role	Role associated with the user. Allowed values are "Basic Access", "Full Access" and "External Access".
6	Message Type	Type of the message sent to the enrollment user. Allowed values are: Email, SMS, NONE.
7	Message Template ID	Unique ID of the template of the confirmation Email/SMS sent to the User.
Output Tab:		
No.	Field Name	Description
1	UUID	Specify an output fieldname to hold the UUID (Universal Unique Identifier) generated as a result of the step execution.
2	User ID	Specify an output fieldname to hold the User ID generated as a result of the step execution.

2.2 AW: Add Enrollment User To User Group

2.2.1 Description

AW: Add Enrollment User To User Group plugin step adds an enrollment user to an AirWatch User Group.

2.2.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the AirWatch instance Server URL (e.g. https://cn1106.awmdm.com) or IP address of the AirWatch instance. This field is mandatory.

4	Username	Specify a username to authenticate to the AirWatch instance (e.g. xx.xx@automationedge.com). This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Provide the password of the username to authenticate. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Username, Password and API Key for AirWatch instance are validated.
	API Key:	
5	Accept Values from fields	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as Text box.
6	API Key	API Key is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled API Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled API Key field appears as a drop down to select fields from previous steps. API Key is available in system settings when REST API access is enabled in AirWatch. API Key is needed to integrate VMware Identity Manager with AirWatch. Steps to Create REST API Keys in AirWatch: With Admin as account type, you can access all the managed content APIs. To do this navigate to, Groups & Settings > All Settings > System > Advanced > API > REST API, and select Add, to generate an API key for the service and account type as Admin .
Input Tab:		
No.	Field Name	Description

	Input Fields:	
1	Enrollment Username	Specify an Enrollment username which is to be added to a User Group.
2	Custom User Group	Specify the name of the Custom User Group in which enrollment user is to be added. The available Custom User Groups can be found by navigating to Accounts→User Groups→List View menu in AirWatch.

2.3 AW: Deactivate Enrollment User

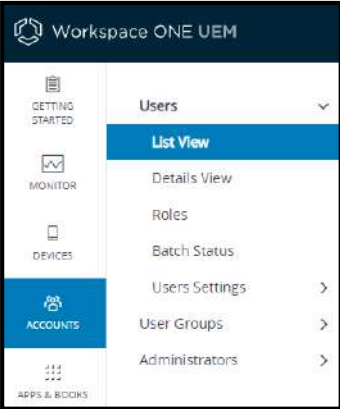

2.3.1 Description

AW: Deactivate Enrollment User plugin step deactivates an AirWatch Enrollment User.

2.3.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Provide Fully Qualified Domain Name/IP address of machine Specify the AirWatch instance Server name Specify the AirWatch instance Server URL (e.g. https://cn1106.awmdm.com) or IP address of the AirWatch instance. This field is mandatory.
4	Username	Specify a username to authenticate to the AirWatch instance (e.g. xx.xx@automationedge.com). This field is mandatory.
	Password:	

5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Provide the password of the username to authenticate. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Username, Password and API Key for AirWatch instance are validated.
	API Key:	
5	Accept Values from fields	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as Text box.
6	API Key	API Key is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled API Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled API Key field appears as a drop down to select fields from previous steps. API Key is available in system settings when REST API access is enabled in AirWatch. API Key is needed to integrate VMware Identity Manager with AirWatch. Steps to Create REST API Keys in AirWatch: With Admin as account type, you can access all the managed content APIs. To do this navigate to, Groups & Settings >All Settings > System > Advanced > API > REST API, and select Add, to generate an API key for the service and account type as Admin . Username, Password and API Key for AirWatch instance are validated.
Input Tab:		
No.	Field Name	Description
	Input Fields:	

1	Enrollment Username	<p>Specify the Enrollment username which is to be deactivated in AirWatch.</p> <p>Existing Enrollment users can be found by navigating to Accounts→Users→List View menu in AirWatch.</p> 
---	---------------------	--

2.4 AW: Remove Enrollment User from User Group

2.4.1 Description

AW: Remove Enrollment User From User Group plugin step removes an Enrollment User from an AirWatch User Group.

2.4.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the AirWatch instance Server URL (e.g. https://cn1106.awmdm.com) or IP address of the AirWatch instance. This field is mandatory.
4	Username	Specify a username to authenticate to the AirWatch instance (e.g. xx.xx@automationedge.com). This field is mandatory.
	Password:	
5	Accept Values from fields	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
6	Password	Provide the password of the username to authenticate.

		<p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p>Username, Password and API Key for AirWatch instance are validated.</p>
	API Key:	
5	Accept Values from fields	<p>Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as Text box.</p>
6	API Key	<p>API Key is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled API Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled API Key field appears as a drop down to select fields from previous steps.</p> <p>API Key is available in system settings when REST API access is enabled in AirWatch. API Key is needed to integrate VMware Identity Manager with AirWatch.</p> <p>Steps to Create REST API Keys in AirWatch: With Admin as account type, you can access all the managed content APIs. To do this navigate to, Groups & Settings > All Settings > System > Advanced > API > REST API, and select Add, to generate an API key for the service and account type as Admin.</p>
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Enrollment Username	Specify an Enrollment username which is to be removed from a User Group.
2	Custom User Group	Specify the name of the Custom User Group from which enrollment user is to be removed

3 Amazon EC2

Amazon EC2 plugin steps perform Amazon EC2 Virtual Machine operations.

Steps to Create Access Key ID and Secret Access Key:

Access Key and Secret Key are required for all Amazon EC2 Plugin steps.

Log on to your Amazon AWS Console (<https://console.aws.amazon.com>) and follow the procedure to create Access Key and Secret Key.

1. Click on the **AWS logged in username** in the top right side.
2. Click on **'My Security Credentials'**.
3. Click on **'Access keys (access key ID and secret access key)'**.
4. Click on **'Create New Access Key'**.
5. Your keys are now created. Either click on **'Show Access Key'** to see the generated keys or Click on **'Download Key File'** which contains the keys.

Prerequisites:

- Amazon AWS cloud instance with access details.
- Login details [Access key and Secret key] to authenticate to Amazon AWS cloud. These can be found under AWS Management Console → User Icon → Security Credentials navigation. Refer "Steps to Create Access Key ID and Secret Access Key" in the Plugin header for details.

3.1 Amazon EC2: Attach Volume

Reference:

https://docs.aws.amazon.com/AWSEC2/latest/UserGuide/device_naming.html#available-ec2-device-names

3.1.1 Description

Amazon EC2: Attach Volume step attaches an EBS volume to a running or stopped instance and exposes it to the instance with the specified device name.

3.1.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	

2	Region	Specify the region where the instance is hoisted or choose a region from the Region Explorer window.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
4	Access Key	Specify an Access Key to authenticate EC2 instance on Amazon AWS cloud. This field is mandatory.
5	Secret Key	Specify a Secret Key to authenticate Amazon AWS cloud. This field is mandatory.
6	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key, and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static (hardcoded) values and environment variables are allowed. It will not work for previous step fields.

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Volume ID	Select the ID of the EBS volume. The volume and instance must be within the same availability zone. Data type is String. This field is mandatory.
	Button: Get	Click to get the list of volume IDs.
2	Instance ID	Select the ID of the instance to which you want to attach the volume ID. Data type is String. This field is mandatory.
	Button: Get	Click to get the list of instance IDs.
3	Device	Select the device name. For example, /dev/sdh or xvdh. Data type is String. This field is mandatory.

Output Tab:

Field Name	Description
Status	Specify the status of attach operation, which will be given as output through this field. The default value is 'Status'.

3.2 Amazon EC2: Create Key Pair

3.2.1 Description

Amazon EC2: Create Key Pair step creates an ED25519 or 2048-bit RSA key pair with the specified name in the Amazon AWS account.

Note: ED25519 keys are not supported for Windows instances, EC2 Instance Connect, and EC2 Serial Console.

3.2.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If the above checkbox is enabled, Access Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled, Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If above checkbox is enabled, Secret Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Key Pair Name	Select name of a key pair. The field type is String. This field is mandatory.
2	Local File Path To Download Key At	Specify the local file path where you want to download the key. The field type is String. This field is mandatory.
3	Button: Browse	Click Browse button to select the file path to download the key.
4.	Key Pair Type	Select the type of key pair. Allowed values are: rsa or ed25519. Default value: rsa The field type is String. This field is mandatory.
5	Tags	Provide the key and value in tabular format if you want to give a tag to your security group. Note: <u>You can add up to 50 tags in each Key Pair.</u>
	Tabular Fields	Note: <u>You can provide a Tag Name without providing the value in the Value field. However, you cannot provide only the value without the Tag Name. Validations are applied to ensure that the condition is fulfilled.</u>
6	Key	Select if you want to give a tag, then provide the tag key name in this field.
7	Value	Select value for the respective Tag Key Name.

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	RSA Key	Specify the generated key as output through this field. The default value is 'RSAKey'.

3.3 Amazon EC2: Create Security Group

3.3.1 Description

Amazon EC2: Create Security Group step creates a new security group in the Amazon AWS account.

3.3.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If the above checkbox is enabled, Access Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled, Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If above checkbox is enabled, Secret Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Security Group Name	Select name security group.

		<p>The field type is String. This field is mandatory.</p> <p>Note: <u>Following constraints are applied:</u></p> <ul style="list-style-type: none"> • <u>Security Group Name can have up to 255 characters. It cannot start with <i>sg</i>.</u> • <u>For EC2 Classic, ASCII characters are allowed.</u> • <u>For EC2-VPC, a-z, A-Z, 0-9, spaces, and <i>._-:/()#,@[]+=&:{}!\$*</i> are allowed.</u>
2	Group Description	<p>Select the description of the security group. The field type is String. This field is mandatory.</p> <p>Note: <u>Following constraints are applied:</u></p> <ul style="list-style-type: none"> • <u>Group Description can have up to 255 characters.</u> • <u>For EC2 Classic, ASCII characters are allowed.</u> • <u>For EC2-VPC, a-z, A-Z, 0-9, spaces, and <i>._-:/()#,@[]+=&:{}!\$*</i> are allowed.</u>
3	VPC ID	Select the ID of the VPC in which you want to create the security group.
	Button: Get	Click Get button to get a list of VPC ID.
4	Tags	<p>Provide the key and value in tabular format if you want to give a tag to your security group.</p> <p>Note: <u>You can add up to 50 tags in each Security Group.</u></p>
	Tabular Fields	<p>Note: <u>You can provide a Tag Name without providing the value in the Value field. However, you cannot provide only the value without the Tag Name. Validations are applied for checking that the condition is fulfilled.</u></p>
5	Key	Select if you want to give a tag, then provide the tag key name in this field.
6	Value	Select value for the respective Tag Key Name.

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Group ID	Specify the generated ID of newly created Security Group is given as output through this field.

	The default value is 'GroupID'.
--	---------------------------------

3.4 Amazon EC2: Create Volume

3.4.1 Description

Amazon EC2: Create Volume step creates an EBS volume that you can attach to an instance in the same availability zone.

Note:

- **Size of volume in GiBs:** You must specify either a snapshot ID or a volume size. If you specify a snapshot, the default is the snapshot size. You can specify a volume size that is equal to or larger than the snapshot size. Following are the sizes of the supported volumes for each volume type:
 - gp2 and gp3: 1-16,384
 - io1 and io2: 4-16,384
 - st1 and sc1: 125-16,384
 - standard: 1-1,024
- The volume type parameter can be one of the following values:
 - General Purpose SSD: gp2 | gp3
 - Provisioned IOPS SSD: io1 | io2
 - Throughput Optimized HDD: st1
 - Cold HDD: sc1
 - Magnetic: standard

If you enable Multi-Attach, you can attach the volume to up to 16 Instances built on the Nitro System in the same Availability Zone. This parameter is supported with io1 and io2 volumes only.

- The number of I/O operations per second (IOPS). For gp3, io1, and io2 volumes, this represents the number of IOPS that are provisioned for the volume. For gp2 volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting. The following are the supported values for each volume type:
 - gp3: 3,000-16,000 IOPS
 - io1: 100-64,000 IOPS

- io2: 100-64,000 IOPS

io1 and io2 volumes support up to 64,000 IOPS only on Instances built on the Nitro System. In other instances, families support performance up to 32,000 IOPS.

3.4.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If the above checkbox is enabled, Access Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled, Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If above checkbox is enabled, Secret Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Availability Zone	Specify the availability zone in which to create the volume. The field type is String. This field is mandatory.
2	Volume Size(GiB)	Specify the size of the volume, in GiBs. If you specify a snapshot, the default is the snapshot size. You can specify a volume size that is equal to or larger than the snapshot size. Note: 1 GiB = 1024 ³ bytes, whereas 1 GB = 1000 ³ bytes. One between Snapshot ID or Volume Size is mandatory.
3	Snapshot ID	Specify the snapshot from which to create the volume. One between Snapshot ID or Volume Size is mandatory.
4	Volume Type	Select the volume type. Valid Values: standard io1 io2 gp2 sc1 st1 gp3.
5	Encrypt This Volume	Indicates whether the volume should be encrypted. Allowed Values are 'Yes' and 'No'. The default value is 'No'.
5.a	KMS Key ID	The identifier of the AWS Key Management Service (AWS KMS) KMS key is used for Amazon EBS encryption. Specify KmsKeyId, however, if you do not specify the KmsKeyId, then the AWS KMS key for Amazon EBS is used.
6	Enable Multi Attach	Indicates whether to enable Amazon EBS Multi-Attach. If you enable Multi-Attach, you can attach the volume to up to 16 Instances built on the Nitro System in the same Availability Zone. This parameter is supported with io1 and io2 volumes only. Allowed Values are 'Yes' and 'No'. The default value is 'No'.
7	Throughput(M/s)	Specify the throughput to provision for a volume, with a maximum of 1,000 MiB/s. This parameter is valid only for gp3 volumes. Valid Range: Minimum value of 125. The maximum value of 1000.
8	Number of IOPS	Specify the number of I/O operations per second (IOPS). This parameter is required for io1 and io2 volumes. This parameter is not supported for gp2, st1, sc1, or standard volumes.
9	Tags	Select if you want to give a tag to your volume.

9.a	Key	If you want to give a tag, then provide the tag key name in this field.
9.b	Value	Specify the value for that respective Tag Key Name.

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Volume ID	Specify the ID of the volume is given as output through this field. The default value is 'VolumeID'.

3.5 Amazon EC2: Delete Key Pair

3.5.1 Description

Amazon EC2: Delete Key Pair step deletes the specified key pair by removing the public key from Amazon EC2.

3.5.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If the above checkbox is enabled, Access Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled, Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.

6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If above checkbox is enabled, Secret Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Key Pair Name	Specify the name of key pair which you want to delete. The field type is String. This field is mandatory.
2	Get	Click the button to fetch the list of all key pair available in your AWS account in a specified region.

3.6 Amazon EC2: Delete Volume

3.6.1 Description

Amazon EC2: Delete Volume step deletes the specified EBS volume.

3.6.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.

3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If the above checkbox is enabled, Access Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled, Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If above checkbox is enabled, Secret Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Volume ID	Specify the volume ID of that volume which you want to delete. The field type is String. This field is mandatory.
2	Get	Click the button gets a list of all Volume IDs in your AWS account in a specified region.

3.7 Amazon EC2: Detach Volume

3.7.1 Description

Amazon EC2: Detach Volume step detaches an EBS volume from an instance in the Amazon AWS account.

3.7.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If the above checkbox is enabled, Access Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled, Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If above checkbox is enabled, Secret Key field appears as Text box and accepts static values or variables. And if the above checkbox is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud.

		For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Volume ID	Select the ID of the volume to be detached. The field type is String. This field is mandatory.
	Button: Get	Click Get button to get a list of volume ID.
2	Instance ID	Select the ID of the instance. Note: If you are detaching a multi-attach enabled volume, you must specify an instance ID.
	Button: Get	Click Get button to get a list of instance ID.
3	Force Detach Volume	Select to force detach a volume, if the previous detachment attempt did not occur cleanly. Select Yes or No. The default value is No.
4	Device	Select the name of the device.

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Status	Specify the status of detach operation as output through this field. The default value is Status.

3.8 Amazon EC2: Get Instance Properties

3.8.1 Description

Amazon EC2: Get Instance Properties step fetches the properties of all EC2 instances on the specified Amazon AWS cloud account.

Prerequisites:

- Amazon AWS cloud instance with access details.
- Login details [Access key and Secret key] to authenticate to Amazon AWS cloud. Refer “Steps to Create Access Key ID and Secret Access Key” in the Plugin header for details.

Note:

As this step generates multiple rows use this as the first step in the workflow.

3.8.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hoisted or choose a region from the Region Explorer window.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
5	Access Key	Specify an Access Key to authenticate EC2 instance on Amazon AWS cloud. This field is mandatory.
7	Secret Key	Specify a Secret Key to authenticate Amazon AWS cloud. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static (hardcoded) values and environment variables are allowed. It will not work for previous step fields.
Output Tab:		
No.	Field Name	Description
	Output Fields (Tabular):	
1	Field Name	On click of the cell in the output table, if the connection is successfully established, it populates the list of instance properties. Select an instance property in a field or many in the table as desired.
2	Output Field	Specify an output field to hold the field values for the field name specified above.

3.9 Amazon EC2: Get Instance Properties By Instance ID**3.9.1 Description**

Amazon EC2: Get Instance Properties By Instance ID step fetches properties of any specific EC2 instance.

3.9.2 Configurations

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
4	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. The field type is String. This field is mandatory.
5	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance.
6	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Instance ID	Select the ID of the instance you want to perform an operation. The field type is String. This field is mandatory.

Output Tab:

No.	Field Name	Description
	Output Field:	
1	XML	Specify the result of the step as XML output through this field. The default value is XML.

3.10 Amazon EC2: Launch Instance

3.10.1 Description

Amazon EC2: Launch Instance plugin step launches an EC2 instance on the specified Amazon AWS cloud account.

Prerequisites

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

- Login details [Access key and Secret key] to authenticate to Amazon AWS cloud. These can be found under AWS Management Console → User Icon → Security Credentials navigation. Refer “Steps to Create Access Key ID and Secret Access Key” in the Plugin header for details.

3.10.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud.

		For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Amazon Machine Image	Specify Amazon Machine Image (AMI) Id to be launched.
2	Instance Type	Specify Instance Type of the AMI to be launched.
3	Button: Get	Click Get button to get a popup containing list of Instance types.
4	Number of Instances	Specify Number of instances to be created.
5	Subnet ID	Specify the ID of an existing Subnet in which instance is to be launched.
6	Button: Get	Click Get button, if the connection is successfully established it populates the list of subnet IDs available on the Amazon AWS cloud.
7	Security Group	Specify Security Group in which instance is to be launched.
8	Button: Get	Click Get button to get a popup containing list of Security Groups.
9	Key Pair Name	Specify Key Pair Name to be assigned to the instance.
10	Button: Get	Click Get button to get a popup containing list of Key Pair Names.

Tip: You may use Get Instance Properties as the first step in the workflow to fetch these properties for all the EC2 instances on this AWS cloud account other than fetching them manually from EC2 web portal.

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Instance Id	Specify an output field to hold the Instance Id of the newly created Virtual Machine instance launched as a result of step execution.

3.11 Amazon EC2: Reboot Instance

3.11.1 Description

Amazon EC2: Reboot Instance plugin step reboots an EC2 instance on the specified Amazon AWS cloud account.

Prerequisites

- Login details [Access key and Secret key] to authenticate Amazon AWS cloud.

Refer “Steps to Create Access Key ID and Secret Access Key” in Plugin header for details.

3.11.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud.

		For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Instance Id	Specify the EC2 Virtual Machine Instance Id to be restarted.

3.12 Amazon EC2: Start Instance

3.12.1 Description

Amazon EC2: Start Instance plugin step is designed to start an EC2 instance on the specified Amazon AWS cloud account.

Prerequisites:

Login details [Access key and Secret key] to authenticate Amazon AWS cloud. Refer “Steps to Create Access Key ID and Secret Access Key” in Plugin header for details.

3.12.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is

		disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Instance Id	Specify the EC2 Virtual Machine Instance Id to be started.
Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Current State	Specify an output field to hold the current state of the instance after successful plugin execution. Default value for this field is "CurrentState". Current State label value is mandatory.
2	Previous State	Specify an output field to hold the previous state of the instance before successful plugin execution. Default label value for this field is "PreviousState". Previous State label value is mandatory.

3.13 Amazon EC2: Stop Instance

Amazon EC2: Launch Instance plugin step stops an EC2 instance on the specified Amazon AWS cloud account.

Prerequisites:

Login details [Access key and Secret key] to authenticate Amazon AWS cloud. Refer “Steps to Create Access Key ID and Secret Access Key” in the Plugin header for details.

3.13.1 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.
4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow

		is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Instance Id	Specify the Virtual Machine Instance Id to be stopped.
Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Current State	Specify an output field to hold the current state of the instance after successful plugin execution. Default value for this field is "CurrentState". Current State label value is mandatory.
2	Previous State	Specify an output field to hold the previous state of the instance before successful plugin execution. Default label value for this field is "PreviousState". Previous State label value is mandatory.

3.14 Amazon EC2: Terminate Instance

Amazon EC2: Terminate Instance plugin step terminates an EC2 instance on the specified Amazon AWS cloud account.

Prerequisites:

Login details [Access key and Secret key] to authenticate Amazon AWS cloud. Refer "Steps to Create Access Key ID and Secret Access Key" in the Plugin header for details.

3.14.1 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or choose a region from the Region Explorer window. The field type is String. This field is mandatory.
3	Button: Get	Click Get button to open the Region Explorer window. Choose a Region.
	Access Key:	Access key to authenticate Amazon AWS cloud.

4	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
5	Access Key	Specify the Access Key to authenticate Amazon AWS cloud EC2 instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
6	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
7	Secret Key	Specify the Secret Key to authenticate Amazon AWS Cloud EC2 instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
8	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon AWS cloud. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Instance Id	Specify the EC2 Instance Id to be terminated.
Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Current State	Specify an output field to hold the current state of the instance after successful plugin execution. Default value for this field is "CurrentState". Current State label value is mandatory.

2	Previous State	Specify an output field to hold the previous state of the instance before successful plugin execution. Default label value for this field is "PreviousState". Previous State label value is mandatory.
---	----------------	--

4 Amazon S3

Amazon S3 Plugin steps perform actions on S3 buckets.

Prerequisites:

- Amazon S3 instance with access details.
- Connection parameters like Access Key and Secret Key should be generated beforehand from the Amazon S3 console.

Reference:

- Generate Access Key and Secret Key –

<https://docs.aws.amazon.com/powershell/latest/userguide/pstools-appendix-sign-up.html>

4.1 Amazon S3: Add Tag To Bucket

4.1.1 Description

Amazon S3: Add Tag To Bucket plugin step adds a tag to the existing Amazon S3 bucket.

Note:

- Each S3 bucket has a tag set. A tag set contains all of the tags that are assigned to that bucket. A tag set can contain as many as 50 tags, or it can be empty. Keys must be unique within a tag set, but values in a tag set do not have to be unique. For example, you can have the same value in tag sets named *project/Trinity* and *cost-center/Trinity*.
- Within a bucket, if you add a tag that has the same key as an existing tag, the new value overwrites the old value.

4.1.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.

	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the bucket to which the tag will be added. This field is mandatory.
2	Button: Get	Click Get button, populates the list of Buckets on the Amazon S3 instance for a specific region.
3	Tag Key	Specify the tag key, which is the name of the tag. For example, in the tag <i>project/Trinity</i> , the <i>project</i> is the key. This field is mandatory. Note:

		The tag key is a case-sensitive string that can contain 1 to 128 Unicode characters.
4	Tag Value	<p>Specify the tag value, which is a required string. For example, in the tag <i>project/Trinity</i>, <i>Trinity</i> is the value.</p> <p>Note: The tag value is a case-sensitive string that can contain from 0 to 256 Unicode characters.</p>

4.2 Amazon S3: Create Bucket

4.2.1 Description

Amazon S3: Create Bucket plugin step creates a bucket on Amazon S3. Bucket names must be unique across all of Amazon S3, that is, among all their users. Within Amazon S3, only a single user owns each bucket. Ownership of the bucket is retained as long as the owner has an Amazon S3 account.

4.2.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.

5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Bucket Name	<p>Specify the name of the S3 bucket to create.</p> <p>To conform with Amazon S3, bucket names must meet the following requirements –</p> <ul style="list-style-type: none"> • Bucket names should not contain underscores • Bucket names should have 3 to 63 characters • Bucket names should not end with a dash • Bucket names cannot contain adjacent periods • Bucket names cannot contain dashes next to periods (e.g., “my-.bucket.com” and “my.-bucket” are invalid) • Bucket names cannot contain uppercase characters <p>Note:</p> <ul style="list-style-type: none"> • Bucket names must be unique in the Amazon S3 instance across the users. • An Amazon S3 bucket name is globally unique, and the namespace is shared by all AWS accounts. This means that after a bucket is created, the name of that bucket cannot be used by another AWS account in any AWS Region until the bucket is deleted.

Additional Input Tab:

No.	Field Name	Description
	Additional Input Field:	
1	Object Lock	<p>Allowed values are: Enabled or Disabled.</p> <p>When enabled, the object will be prevented from being deleted or overwritten until the hold is explicitly removed. The objects can be stored using the write-once-read-many (WORM) model.</p> <p>Object Lock only works in versioned buckets; and enabling Object Lock automatically enables bucket versioning.</p> <p>The data type is String.</p>

4.3 Amazon S3: Create Folder

4.3.1 Description

Amazon S3: Create Folder plugin step creates a folder (object) in a bucket on Amazon S3. Amazon S3 folder/subdirectory is considered as an object. By creating folders in buckets, it enables the user to maintain the hierarchy.

4.3.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.

5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the S3 bucket in which the folder is to be created. The field type is String. This field is mandatory.
2	Button: Get	Click the button to open the bucket explorer, with the list of Buckets on the Amazon S3 instance for a specific region.
3	Folder Name	The name of the folder, by which the folder is created. The field type is String. This field is mandatory. Note: Create a folder into the folder, (e.g. "foldername1/foldername2", will create folder "foldername2" in folder "foldername1"

4.4 Amazon S3: Delete Bucket

4.4.1 Description

Amazon S3: Delete Bucket step, deletes a bucket from Amazon S3.

Note: Delete all objects in the bucket, including versions of objects and delete markers, if Bucket Versioning is enabled before deleting the bucket.

4.4.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:

No.	Field Name	Description
	Input Fields:	

1	Bucket Name	<p>Specify the name of the S3 bucket to be deleted. The field type is String. This field is mandatory.</p> <p>Note:</p> <p>Delete all objects in the bucket, such as versions of objects and delete markers if bucket versioning is enabled before deleting the bucket.</p>

- Bucket versioning enabled – <https://docs.aws.amazon.com/AmazonS3/latest/userguide/DeletingObjectVersions.html>
- Bucket versioning suspended – <https://docs.aws.amazon.com/AmazonS3/latest/userguide/DeletingObjectsfromVersioningSuspendedBuckets.html>
- Working with delete markers – <https://docs.aws.amazon.com/AmazonS3/latest/userguide/DeleteMarker.html>
- Deleting Amazon S3 objects – <https://docs.aws.amazon.com/AmazonS3/latest/userguide/DeleteMarker.html>

4.5.1 Description

Amazon S3: Delete file plugin step, deletes a file from a bucket on Amazon S3. To delete an object there are two available options: -

- Delete an object with a specific version by specifying a version ID. S3 bucket versioning should be 'enabled'.
- Delete an object without specifying a version ID, in which case S3 adds a delete marker to the object.

Note: The operation can be performed by the owner of the bucket. If Bucket Versioning is not enabled, there is no way to restore the deleted object.

4.5.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window.

		The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the S3 bucket from which the object is to be deleted. The field type is String. This field is mandatory.
2	Get	On click of this button, it populates the list of Buckets on the Amazon S3 instance for a specific region.

3	Key Name	The object name that is to be deleted. It deletes a single file. If the file resides in any folder, it should be given as “foldername/filename.extension”. The field type is String. This field is mandatory.
4	Version ID	The specific version ID of the object to be deleted. Bucket versioning should be enabled.

Notes:

- The Key Name field is the Object’s Key name.
- To delete an object of a specific version, S3 bucket versioning should be enabled.
- Bucket versioning Notes –
 - I. For Files -
 - a) When versioning is disabled, then objects will be permanently deleted.
 - b) When versioning is enabled, a simple DELETE cannot permanently delete an object. Instead, Amazon S3 inserts a delete marker in the bucket, and that marker becomes the current version of the object with a new ID. To delete versioned objects permanently, the version ID field value should be provided (If version ID is null, provide ‘null’ value in version ID field).
 - c) When versioning is suspended for a bucket, then for a DELETE request,
 - i. It only removes objects with version ID is null.
 - ii. It does not remove anything if there is not a null version of the object in the bucket.
 - iii. Inserts a delete marker into the bucket.
 - iv. Amazon S3 inserts a delete marker in its place with a version ID of null.
- Specify a versioned delete request — specify both the key and a version ID. In this case, the following two outcomes are possible:
 - a) If the version ID maps to a specific object version, Amazon S3 deletes the specific version of the object.
 - b) If the version ID maps to the delete marker of that object, Amazon S3 deletes the delete marker. This makes the object reappear in your bucket.
- Once the object is deleted using the plugin step and the workflow is re-run, the workflow will be successful.
- "The key must be specified when deleting a version" error may occur due to following reasons -
 - a) The provided version ID does not exist.
 - b) The provided version ID is not associated to the provided Key Name.

Known Issue:

- If non-existing file is given in Key Name field, it will create the file with Delete marker.

4.6 Amazon S3: Download File

4.6.1 Description

Amazon S3: Download File plugin step downloads a single file (object) from a bucket on Amazon S3.

Reference Link:

Downloading an Object –

<https://docs.aws.amazon.com/AmazonS3/latest/userguide/download-objects.html>

4.6.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.

7	Button: Test Connection	<p>Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance.</p> <p>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>
---	-------------------------	--

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Bucket Name	<p>Specify the name of the S3 bucket from where the object is to be downloaded.</p> <p>The data type is string. The field is mandatory.</p>
2	Get	<p>On click of this button, it populates the list of Buckets on the Amazon S3 instance for a specific region.</p>
3	Key Name	<p>The object name that is to be downloaded. It downloads a single object(file). If the file resides in any folder, it should be given as “foldername/filename.extension”.</p> <p>The data type is string. The field is mandatory.</p> <p>Notes:</p> <ul style="list-style-type: none"> • The Key Name field is the Object’s Key name. • If the file to be downloaded resides in any folder/subdirectory, the Key Name should be given as “foldername/filename.extension”.
4	Output Folder Path	<p>Folder path to download a file at the given location.</p> <p>The data type is string. The field is mandatory.</p>
5	Browse	<p>To browse the folder path to download a file from Amazon S3.</p>
6	Version ID	<p>The specific version ID of the object to be downloaded. Bucket versioning should be enabled. The data type is string.</p> <p>Notes:</p> <ul style="list-style-type: none"> • To download an object of a specific version, S3 bucket versioning should be enabled. • If the version ID is not given, the latest file (without the ‘L’ marker) is downloaded.

Additional Input Tab:

No.	Field Name	Description
-----	------------	-------------

	Additional Input Field:	
1	Delete Output Folder Contents Before Downloading	Specify Yes to delete output folder contents before downloading else Specify No. Allowed values: Yes, No. Default value: No. The data type is string.
2	Add Date TimeStamp For Duplicate File	Specify Yes to add Date TimeStamp for duplicate files. Allowed values: Yes, No. Default value: No. The data type is string.
3	Add File To Result	Specify Yes to add the downloaded files to the result set and display the download link on AE otherwise else select No. Allowed values: Yes, No. Default value: No. The data type is string.
Output Tab:		
No.	Field Name	Description
	Additional Input Field:	
1	File Overwritten	Specify a field name that returns Yes if the file is overwritten else No. This field is mandatory.

Known Issues:

If the internet connection is disconnected in the middle of downloading a file, the contents will be partially downloaded to the point where the internet was disconnected.

4.7 Amazon S3: Download Folder

4.7.1 Description

Amazon S3: Download Folder plugin step downloads a single folder (object) from a bucket on Amazon S3.

Reference Link:

Downloading an Object

<https://docs.aws.amazon.com/AmazonS3/latest/userguide/download-objects.html>

4.7.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window.

		The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the S3 bucket from where the object is to be downloaded. <u>The data type is String. This field is mandatory.</u>
2	Get	Click to populate a list of Buckets on the Amazon S3 instance for a specific region. Note:

		If no buckets are available it throws an error.
3	Key Name	The object name that is to be downloaded. It downloads a single object(folder). <u>The data type is String. This field is mandatory.</u> Notes: <ul style="list-style-type: none"> • The Key Name field is the Object's Key name. • If the "null" value is given in Key Name, all the contents in the given bucket will be downloaded.
4	Output Folder Path	Folder path to download a folder at the given location. <u>The data type is String. This field is mandatory.</u>
5	Browse	To browse the folder path to download a folder from Amazon S3.
Additional Input Tab:		
No.	Field Name	Description
	Additional Input Field:	
1	Delete Output Folder Contents Before Downloading	Specify Yes to delete output folder contents before downloading else Specify No. Allowed values are: Yes, No. The default value is No. <u>The data type is String.</u>

Known Issues:

1. If an empty folder that is folder that does not contain any file is given, it will execute the workflow, but nothing will be downloaded.
2. If the internet connection is disconnected in the middle of downloading a folder, the contents will be partially downloaded to the point where the internet was disconnected.

4.8 Amazon S3: Get Bucket List

4.8.1 Description

Amazon S3: Get Bucket List step fetches the list of buckets on Amazon S3.

4.8.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.

	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Bucket Name	Specify the name of the S3 bucket to get the list of the bucket(s) in the Amazon S3. Default value: <i>BucketName</i> <u>The data type is String. This field is mandatory.</u>

4.9 Amazon S3: Get Objects From Bucket

4.9.1 Description

Amazon S3: Get Objects From Bucket plugin step Gets the list of objects from a bucket on Amazon S3. The call returns some or all (up to 1000) objects in a bucket.

4.9.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the S3 bucket to get objects. <u>The data type is String. This field is mandatory.</u> <u>Note:</u> If no buckets are available it throws an error.
2	Get	Click Get button, to populates a list of Buckets on the Amazon S3 instance.
Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Object Name	The name of the Object (Key) in the bucket. It returns the names of files as well as folders. Note: To get the list of objects from a bucket a user must have Read permission on the bucket.
2	ETag	The ETag (entity tag) is the hash of an object.
3	Object Size	The object size returns the size of each object in the bucket.
4	Last Modified	The last modified is the date of the modification of the objects.
5	Storage Class	It returns the Storage class of the object. Storage classes offer higher durability.

4.10 Amazon S3: List Versions Of Objects

4.10.1 Description

Amazon S3: List Versions Of Objects plugin step lists the versions of objects from a versioning-enabled bucket.

Note:

To get the list of objects and version IDs from a bucket a user must have **Read** permission on the bucket.

4.10.2 Configurations

2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the bucket from which the objects are to be got.

		<u>The data type is String. This field is mandatory.</u>
2	Get	Click Get button, to populates a list of Buckets on the Amazon S3 instance.
3	Prefix	Specify the prefix parameter restricts the response to keys that begin with the specified prefix. Note: If the object resides in the folder, provide the prefix as foldername/<prefix> . For example, <i>testFolder/abc</i>
Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Object Name	Specify the name of the Object (Key) in the bucket. It returns the names of files and folders. Default value: <i>ObjectName</i>
2	Version	Returns the Version ID of the Object. Default value: <i>VersionID</i>
3	Is Latest	Returns whether or not this version is the latest version for the associated object. Default Value: <i>IsLatest</i>
4	Is Delete Marker	Returns whether or not this version represents a delete marker. Default Value: <i>IsDeleteMarker</i>

4.11 Amazon S3: Upload Directory

4.11.1 Description

Amazon S3: Upload Directory plugin step uploads multiple files and subdirectories to the Amazon S3 bucket.

Permissions:

- To upload an object, the user must have “**write**” permission on the bucket.
- If Object Name is not given, the files will be uploaded to the root of the bucket.

4.11.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	

2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.
Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the S3 bucket in which the directory is to be uploaded. The data type is string. The field is mandatory.

2	Get	<p>On click of this button, it populates the list of Buckets on the Amazon S3 instance.</p> <p>Note: If no buckets are available should throw an error.</p>
3	Object Name	<p>Specify a folder in the S3 bucket in which files are to be uploaded. Keep it blank to upload files to the root of the bucket.</p>
4	Directory Path	<p>Specify the directory name that is to be uploaded. It is the path to the directory which is uploaded on the Amazon S3 bucket. The data type is string. The field is mandatory.</p> <p>Note: If the directory or sub-directory is empty, that is, does not contain files, then the workflow will be successful but the empty directory or sub-directory won't be uploaded to the UI.</p>
5	Browse	<p>Click to browse the directory path to upload multiple files in the Amazon S3 bucket.</p>
6	Include Subdirectories	<p>Select if you want to include subdirectories in the upload. If true, files found in subdirectories will be included uploaded. Default Value: <i>No</i></p>

4.12 Amazon S3: Upload File

4.12.1 Description

Amazon S3: Upload File plugin step Creates/Uploads an object in a bucket of Amazon S3.

Permissions:

To create/upload an object, the user must have **“write”** permission on the bucket.

4.12.2 Prerequisites

- You must have an Amazon S3 instance with access details.
- Generate connection parameters, such as Access Key and Secret Key from the Amazon S3 console before using this feature.

4.12.3 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	

2	Region	Specify the region where the instance is hosted or click the Get button to choose a region from the Region Explorer window. The field type is String. This field is mandatory.
	Button: Get	Click Get button to open the Region Explorer window populated with the list of Regions available on the Amazon S3 instance. Choose a Region.
	Access Key:	Access key to authenticate an Amazon S3 cloud instance.
3	Accept Values from fields	Leave checkbox unchecked to accept Access Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Key field to appear as Text box.
4	Access Key	Specify the Access Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Access Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Access Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
	Secret Key:	Secret key to authenticate Amazon AWS cloud.
5	Accept Values from fields	Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
6	Secret Key	Specify the Secret Key to authenticate Amazon S3 cloud instance. If checkbox above is enabled Secret Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Secret Key field appears as a drop down to select fields from previous steps. The field type is String. This field is mandatory.
7	Button: Test Connection	Click Test Connection button to verify whether the connection is available or not. Region, Access key and Secret Key are mandatory to authenticate Amazon S3 cloud instance. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Bucket Name	Specify the name of the S3 bucket to create/upload an object. The data type is string. The field is mandatory.
2	Get	On click of this button, it populates the list of Buckets on the Amazon S3 instance.

		Note: If no buckets are available should throw an error.
3	Local File Path	Specify the file path on the local machine to be created/uploaded on the Amazon S3 bucket. The data type is string. The field is mandatory.
4	Browse	To browse the file path to create a file in the Amazon S3 bucket.
5	Key Name	This field is used to Rename a file. The file will be stored in an Amazon S3 bucket with the name given in this field. The data type is string. The field is mandatory. Notes: <ul style="list-style-type: none"> • The Key Name field is used to rename a file. The file will be stored in an Amazon S3 bucket with the name given in this field. • To store the file in a folder, specify the folder name with delimiter “/”. Example: “foldername/filename.extension”. • If the given folder does not exist on the bucket, it will be created. • If the file name is not given in Key Name, it will take the default file name and create an object with that name. • Provide valid file extension, same as the extension of File, given in the “Local File Path” field. • Key name does not support consecutive forward slashes (/).
Additional Input Tab:		
No.	Field Name	Description
	Additional Input Field:	
1	Storage Class	The storage class to assign to the object. The default value is STANDARD. The data type is string.
2	Access Control List	Specify an Access Control List. The Access Control List determines user permissions for the uploaded file. It enables the owner to grant required permissions to other AWS accounts. The default value is Private. The data type is string.
Output Tab:		
No.	Field Name	Description
	Output Field:	

1	Object URL	An object URL is generated by an AWS user who has access to the object. The generated URL is then given to the users without making the bucket private. The data type is string.
---	------------	--

5 Ansible

Ansible is a software provisioning, configuration management, and application-deployment tool. Ansible Plugin steps have been designed to perform Ansible tasks and return results.

5.1 Ansible: Run Playbook

5.1.1 Description

Ansible: Run Playbook step executes an Ansible-playbook command and returns the result over secure shell(ssh) TCP/IP protocol.

5.1.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
Connection Tab:		
No.	Field Name	Description
	Connection Fields:	
2	Server name / IP address	Specify the Server name or IP address of the machine on which you want to execute a command. This field is mandatory.
3	Server port	Specify the TCP/IP port on which ssh protocol lives on the server. The default is 22.
4	Timeout	Specify the timeout in seconds. If set to a number larger than zero you can specify a non-default connection timeout.
5	Username	Specify the username to log in with.
	Password :	
6	Accept value as variable/ static	Leave checkbox unchecked to accept Password from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Specify the Password. This field is mandatory.

		<p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps).</p> <p>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
8	Use key	Enable this option if you want to log in using a private key.
9	Private key	The private key file. The private part of a private/public RSA key-pair (see: ssh-keygen).
10	Passphrase	Specify the optional pass-phrase used when the key-pair was generated.
11	Proxy host	In case the machine is in a proxy environment, specify the proxy server host to use (name or IP address).
12	Proxy port	Specify the proxy server port to use .
13	Proxy username	Specify the proxy user name .
	Proxy password :	
14	Accept value as variable/ static	Leave checkbox unchecked to accept Proxy Password from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Proxy Password field to appear as Text box.
15	Proxy password	<p>Specify the Proxy password. This field is mandatory.</p> <p>Proxy Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps).</p> <p>If checkbox above is enabled Proxy Password field appears as Text box. Else if checkbox above is disabled Proxy Password field appears as a drop down to select fields from previous steps.</p>
16	Test connection	Click to see if the supplied credentials are sufficient for logging into the SSH server.

Input Tab:		
No.	Field Name	Description
1	Host / Client	<p>Specify the server Name or IP address or Group Name of machine which is already present in hosts file and on which you want to perform operation using Ansible.</p> <p>Note: Comma separated values are allowed in this field.</p>
2	Playbook File Path (on Ansible CLI Machine)	Specify YAML File path or Directory path on Ansible CLI Machine. (if user provides a static or environment value and

		<p>user provides “/”, it will auto populate the current directory list in dropdown)</p> <p>Note:</p> <ul style="list-style-type: none"> If user provides value for Playbook File Path (on Ansible Machine) as Static or environment variable, then user can press Linux file separator “/” to auto populate the directory list in dropdown. <ol style="list-style-type: none"> If Both Playbook File Path (on Ansible CLI Machine) and YAML File Path field contains full Yaml path, then first preference will be given to Playbook File Path (on Ansible CLI Machine). If Playbook File Path (on Ansible CLI Machine) contains directory and YAML File Path field contains yaml file with extension, then path will be created as Playbook File Path (on Ansible CLI Machine) + “/” +name of file with extension from YAML File Path field. If Copy/Replace YAML File To Playbook File field value is “Yes” then local yaml file will be created on Playbook File Path (on Ansible CLI Machine) with given directory structure. (if Playbook File Path (on Ansible CLI Machine) Field contains full YAML file path with extension then no file will be copied on Ansible CLI Machine.) If there is special character in filename, then please provide escape characters as per Linux standards.
3	YAML File Path	<p>Specify Local Machine YAML file path.</p> <p>Note: If there is special character in filename, then please provide escape characters as per Linux standards.</p>
4	Browse	Browse Local YAML file and selected file path loaded into YAML File Path.
5	Supporting File	<p>Specify the supporting file name to be copied to the Ansible CLI machine. You can also Browse for the files and click Add button to add to the list below.</p> <p>Note: Variables and previous fields are also allowed in this field.</p>
6	Supporting File List	Displays the playbook supporting files to be copied to the Ansible CLI machine.
7	Copy / Replace YAML File To Playbook File Path	If value is ‘Yes’ then copies local YAML file at Ansible CLI Machine at given Playbook File Path Directory. And if Directory not exists it will create the given Directory. Allowed Values: ‘Yes’ and ‘No’. Default Value ‘No’.

8	Accept Parameter As JSON	Specify Yes to accept Ansible extra-var parameters in JSON format else No to specify parameters as key-value pairs in the Parameters table. The default value is No.
i	JSON	If Yes is provided in the field above, Specify a JSON string for Ansible extra-var parameters. Sample JSON: <code>{"name":"Bob", "email":"bob32@gmail.com"}</code>
ii	Parameters	Specify Key = Value in table field if Checkbox is unchecked. Note: If you are using Table for parameters and you need to specify space separated value or special characters in value then provide value in single quote.
7	Get	Fetches parameters from Playbook File Path and YAML File Path. Priority will be given to Playbook File Path if both Playbook File Path and YAML File Path contains YAML file extension. Note: Get button will fetch YAML file parameters and show in Parameters table from any of Playbook File Path (on Ansible CLI Machine) or YAML File Path field. If both are given, then priority will be given to Playbook File Path (on Ansible CLI Machine)
8	Wait For Response/Max Execution Timeout	Specify timeout duration in seconds. Default 0. When it is 0 it waits for infinite time until result comes. If greater than 0, then wait for specified timeout seconds.

Privilege Escalation Tab:

No.	Field Name	Description
Privilege Escalation (Client Machine)		
1	Use Become	Become another User to execute Playbook. Allowed Values: "Yes", "No". Default value is "No".
2	Become Method	Specify the privilege escalation method to use (default=sudo). Allowed Values: "sudo", "su".
3	Username/ Become Username	Run playbook operations as this user (default=root) Known Issue: If user provides any special sequence of characters which can be used in Ansible commands in Become User field, then workflow is stuck for infinite time.
Become Password:		

4	Accept value as variable/ static	Leave checkbox unchecked to accept Become Password from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Become Password field to appear as Text box.
5	Become Password	Specify the Become Password. This field is mandatory. Become Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Become Password field appears as Text box. Else if checkbox above is disabled Become Password field appears as a drop down to select fields from previous steps.
6	Vault Key	Specify the 'Vault ID without label' or the 'location of file'. Note: Vault IDs help you encrypt different files with different passwords to be referenced inside a playbook. Vault Key is used when multiple level passwords are used. Refer to the URL: https://docs.ansible.com/ansible/2.8/user_guide/vault.html or https://docs.ansible.com/ansible/latest/user_guide/vault.html
7	Vault Password File Path	Specify the 'Vault Password File Path ' or 'Vault ID Label'. Refer to the URL: https://docs.ansible.com/ansible/2.8/user_guide/vault.html or https://docs.ansible.com/ansible/latest/user_guide/vault.html

Extra Parameter Tab:

No.	Field Name	Description
	Extra Ansible Parameters:	
1	Get Input Fields	In this pane the field from previous steps are visible.
2	Extra Ansible Arguments	Specify any extra arguments which will be appended to Ansible-Playbook command. like --force-handlers, --flush-cache, -f <FORKS>, -t <TAGS>, --syntax-check, --list-tags, etc. Note: You can separate these arguments with a space.
3	Prefix Command With Sudo	Specify whether to prefix ansible-playbook command with sudo . Allowed Value: Yes/No. Default is No.

Output Tab:

No.	Field Name	Description
-----	------------	-------------

1	Response fieldname	Specify the name of the String output field that will contain the text passed to the standard output channel (stdOut) by the specified commands. This information can then be picked up by the step and passed in a field to subsequent steps.
2	Error response field name	The name of the String output field that will contain the text passed to the standard error channel (stdErr) by the specified commands. This information can then be picked up by the step and passed in a field to subsequent steps.

6 BMC Remedy

We have Remedy steps to get, insert and update application data in Remedy.

Prerequisites: Access to a Remedy instance from Process Studio / AE agent machine.

6.1 Get Remedy Record

6.1.1 Description

This Plugin step fetches the record details of Remedy Applications like Incident Management, Service Request Management, Change Management, Problem Management and others based on the criteria provided.

6.1.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Server Name	Specify IP, hostname or fully qualified domain name of Remedy server. This field is mandatory.
3	Port Number	Port Number to access Remedy Server. Port must be positive integer value. This field is mandatory.
4	User Name	The username having permission to login to Remedy Server (Ex: - Allen). This field is mandatory.
	Password:	
5	Checkbox: Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.

6	Password	<p>The Password to the username to authenticate to Remedy. Password is encrypted and not stored in the .psw file. This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box for static values or variables. Else if checkbox above is disabled Password field appears as a combo box to select fields from previous steps.</p>
Button:		
7	Test Connection	<p>Test connection with username and password provided. Verifies whether the connection is available or not. Server name, Port number, username and password are mandatory. If invalid username and password are provided connection is established as a guest user.</p> <p>Note: If the connection fields are provided from previous step, then Test Connection Button does not work. Hence, provide connection fields either as static values or environment variables to test connection with the Test Connection Button the first time. All requisite forms and fields in Input and Output fields will now be populated with the corresponding values.</p> <p>Once input and output field values are populated the connection fields may be replace with previous step fields.</p>

Input Tab:		
No.	Field Name	Description
Input Fields:		
1	Form Name	This holds the Remedy form name from which the record details will be fetched.
2	Button: Get Forms	<p>Click on this button to get the list of Forms and select one to populate it into the Form Name field. The list of forms visible depends on the access(/role) permissions of the user.</p> <p>Get Record is done on main forms, for e.g. WOI:WorkOrder to get workorder, HPD:HelpDesk to get incident and CHG:Infrastructure to get for change.</p>
3	Criteria Field	Double click on this field to get the list of fields associated with the selected form.

4	Criteria Value	Specify the valid value for the selected field. If an invalid value is provided then no result record is returned.
---	----------------	--

Output Tab:

No.	Field Name	Description
1	Output Fields:	
2	Field Name	The name of the fields to be fetched should be selected. Multiple fields can be selected from the list displayed on click. The selected field's values will be the output parameters of this plugin.
3	Field Value	Specify the name to the output field which holds the value of the fields selected.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

6.2 Insert Remedy Record

6.2.1 Description

The step is used to create records in Remedy Applications like Incident Management, Service Request Management, Change Management, Problem Management and others. Users can insert into any form according to the permissions.

6.2.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	

1	Server Name	Specify IP, hostname or fully qualified domain name of Remedy server. This field is mandatory.
2	Port Number	Port Number to access Remedy Server. Port must be positive integer value. This field is mandatory.
3	User Name	Remedy login username. (Ex: - Allen). This field is mandatory.
	Password:	
4	Checkbox: Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	<p>The Password to the username to authenticate to Remedy. Password is encrypted and not stored in the .psw file. This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box for static values or variables. Else if checkbox above is disabled Password field appears as a combo box to select fields from previous steps.</p>
	Button:	
6	Test Connection	<p>Test connection with username and password provided. Verifies whether the connection is available or not. Server name, Port number, username and password are mandatory. If invalid username and password are provided connection is established as a guest user.</p> <p>Note: If the connection fields are provided from previous step, then Test Connection Button does not work. Hence, provide connection fields either as static values or environment variables to test connection with the Test Connection Button the first time. All requisite forms and fields in Input and Output fields will now be populated with the corresponding values.</p> <p>Once input and output field values are populated the connection fields may be replace with previous step fields.</p>

Input Tab:		
No.	Field Name	Description
1	Input Fields:	
2	Form Name and Button to Get Forms	Click this button to get a list of Remedy forms. Choose a form from the list to populate the Form Name field. The list of forms visible depends on the access(/role) permissions of the user.

		<p>Once a form is chosen the Criteria field is enabled. Provide a criteria and its value.</p> <p>By using this plugin, we can insert in any interface form which is available in Remedy. For e.g. if creating an incident, you need to insert record in the form: HPD:IncidentInterface_Create, to create a workorder you need to insert record in the form WOI:WorkOrderInterface_Create and to create change you need to insert record in CHG:ChangeInterface_Create.</p>
3	Field Name	Select form field names from the list. The mandatory field names must be chosen and values provided. Else, the step gives an error listing the mandatory fields to be provided.
4	Field Value	Provide values for the corresponding field name chosen above. (e.g. Status=3 for success and 2 for failure, Description=ResultData and Retry Count=3).

Output Tab:

No.	Field Name	Description
1	Output Fields:	
2	Field Name	Choose the outputs field of the form.
3	Output Field	The process studio output field name to store the remedy field values.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	<p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	On click of this button, it will cancel the window and do not save any values

6.3 Update Remedy Record

6.3.1 Description

The step is used to update Remedy Applications like Incident Management, Service Request Management, Change Management, Problem Management and others. For example Remedy Update can be used to close a ticket if resolved.

6.3.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
1	Server Name	Specify IP, hostname or fully qualified domain name of Remedy server. This field is mandatory.
2	Port Number	Port Number to access Remedy Server. Port must be positive integer value. This field is mandatory.
3	User Name	Remedy login username. (Ex: - Allen). This field is mandatory.
	Password:	
4	Checkbox: Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	The Password to the username to authenticate to Remedy. Password is encrypted and not stored in the .psw file. This field is mandatory. If checkbox above is enabled Password field appears as Text box for static values or variables. Else if checkbox above is disabled Password field appears as a combo box to select fields from previous steps.
	Button:	
6	Test Connection	Test connection with username and password provided. Verifies whether the connection is available or not. Server name, Port number, username and password are mandatory. If invalid username and password are provided connection is established as a guest user. Note: If the connection fields are provided from previous step, then Test Connection Button does not work. Hence, provide connection fields either as static values or environment variables to test connection with the Test Connection Button the first time.

		<p>All requisite forms and fields in Input and Output fields will now be populated with the corresponding values.</p> <p>Once input and output field values are populated the connection fields may be replace with previous step fields.</p>
--	--	---

Input Tab:		
No.	Field Name	Description
1	Input Fields:	
2	Form Name and Button to Get Forms	<p>Click this button to get a list of Remedy forms. Choose a form from the list to populate the Form Name field. The list of forms visible depends on the access(/role) permissions of the user.</p> <p>Once a form is chosen the Criteria field is enabled. Provide a criteria and its value.</p> <p>Update is done on main forms, for e.g. WOI:WorkOrder to update workorder, HPD:HelpDesk to update incident, CHG:Infrastructure to update for change.</p>
3	Criteria Field:	Double click to select a field. Provide a value for the selected field.
	Field Name	Select form field names to be updated from the list.
	Field Value	Provide values for the corresponding field name chosen above. (e.g. Status=3 for success and 2 for failure, Description=ResultData and Retry Count=3).

Output Tab:		
No.	Field Name	Description
1	Output Fields:	
2	Field Name	Choose the outputs field of the form.
3	Field Value	The process studio output field name to store the remedy field values.

Common Buttons:		
No.	Field Name	Description

	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

7 BMC Remedy (REST)

We have BMC Remedy (REST) steps to search, insert, update and delete application data in Remedy as well as upload and download attachments to specified fields of a record in Remedy Applications.

Prerequisites: Remedy instance and access details.

AE Compatibility: AutomationEdge 5.X.X

Developed with: BMC Remedy 9.1.0

7.1 Remedy (REST): Delete Record

7.1.1 Description

Remedy (REST): Delete Record plugin step deletes a single record on Remedy Server Applications on a specified form name with field value criterion for deletion.

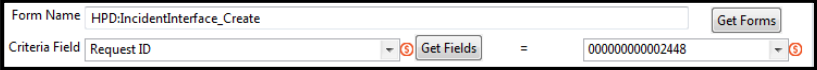

The step is used to delete records in Remedy Applications like Incident Management, Change Management, Problem Management, People Management and others. For example Remedy Delete can be used to delete a people record.

7.1.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
1	AE Server Base URL	Base URL of Remedy server (e.g. http://Server Name or IP:port where Port is the Remedy REST API port). The default REST API port is 8008. This field is mandatory.

2	Username	Specify a username in the Remedy instance having permissions to authenticate and to delete Record on the Remedy server. This field is mandatory.
	Password:	
3	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
4	Password	Specify the password of the user to authenticate to Remedy Server. Password is encrypted and not stored in the .psw workflow file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
	Button:	
5	Test Connection	Test connection based on AE Server Base URL, Port number, username and password. All these fields are mandatory. Test connection button verifies whether the connection is available or not. Note: If the connection fields are provided from previous step, then Test Connection Button does not work.

Input Tab:		
No.	Field Name	Description
1	Input Fields:	
2	Form Name	Double Click this field to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field. Form Name has to be chosen from the Form Explorer window. It will not work for the previous step fields; however Static Values can be provided (e.g. CTM:People, HPD:Help Desk, PBM:Problem Investigation, CHG:Infrastructure Change etc. Users can Delete records from any form according to the permissions.). Once a form is chosen the Criteria field is enabled. Provide a criteria and its value.

3	Button: Get Forms	Click this button to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field.
4	Criteria Field	Double click this field to open the Field Explorer window. Select form field names to set Criteria Field. Criteria Field has to be chosen from the Field Explorer window. It will not work for the previous step fields, Static Values and Environment Variables can also be provided.
5	Button: Get Fields	Click this button to open the Field Explorer window. Select a Criteria form field from the list.
6	Criteria Field Value	<p>Provide a value for the Criteria Field chosen above. For e.g. to delete an incident record in form HPD:IncidentInterface_Create with criteria field RequestID you may provide the Criteria Field Value XXX, where XXX is an existing Request ID as shown below.</p>  <p>However, make sure all the required fields are available in the record for deletion. (For e.g. in case of CTM:People Status should be Delete and Site is required before deletion operation can be carried out).</p>

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Delete Record Id	Specify an output field to hold the result of the step execution that is the Record Id deleted.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing then it will display validation error message.

		If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

7.2 Remedy (REST): Download Attachment

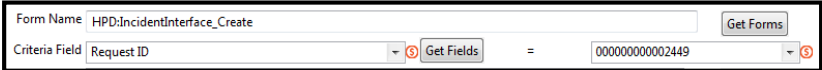

7.2.1 Description

Remedy (REST): Download Attachment plugin step downloads all attachments of the specified Remedy record, on a Remedy Server.

The step is used to download attachments from Remedy Applications like Incident Management, Change Management, Problem Management, People Management and others. For example Remedy Download Attachment can be used to download attachments in a work log.

7.2.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	AE Server Base URL	Base URL of Remedy server (e.g. http://Server Name or IP:port where Port is the Remedy REST API port). The default REST API port is 8008. This field is mandatory.
3	User Name	Specify a username (Ex: - Allen) in the Remedy instance having permissions to authenticate and download attachments of a Record on the Remedy server Applications. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	Specify the password of the user to authenticate to Remedy Server. Password is encrypted and not stored in the .psw workflow file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.

	Button:	
6	Test Connection	<p>Test connection based on AE Server Base URL, Port number, username and password. All these fields are mandatory. Test connection button verifies whether the connection is available or not.</p> <p>Note: If the connection fields are provided from previous step, then Test Connection Button does not work.</p>
Input Tab:		
No.	Field Name	Description
1	Input Fields:	
2	Form Name	<p>Double Click this field to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field. Form Name has to be chosen from the Form Explorer window. It will not work for the previous step fields; however Static Values can be provided (e.g. HPD:WorkLog, PBM:Investigation WorkLog, CHG:WorkLog etc. Users can download attachments from any form records according to the permissions.).</p> <p>Once a form is chosen the Criteria field is enabled. Provide a criteria and its value.</p>
3	Button: Get Forms	Click this button to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field.
4	Criteria Field	<p>Double click this field to open the Field Explorer window. Select form field names to set Criteria Field.</p> <p>Criteria Field has to be chosen from the Field Explorer window. It will not work for the previous step fields; however Static Values and Environment Variables can be provided.</p>
5	Button: Get Fields	Click this button to open the Field Explorer window. Select a Criteria form field from the list.
6	Criteria Field Value	<p>Provide a value for the Criteria Field chosen above.</p> 
7	Output Folder Path	<p>Provide the absolute directory path where the attachments need to be downloaded.</p> 
8	Browse Folder	Click to browse the absolute path of the desired target output folder path.

9	Delete Output Folder Contents before Downloading	Allowed values: Yes or No If given "Yes" then the contents of the target Output folder path will be deleted.
10	Add DateTimeStamp for Duplicate Files	Allowed values: Yes or No If given "Yes" then the new file will be appended with the Date Timestamp in the filename.
11	Add File To Result	Allowed values: Yes or No. If given "Yes", After execution the link to download the file will be visible on Automation Edge portal.

Output Tab:

No.	Field Name	Description
	Output Fields:	
1	Total Files	Specify an output fieldname to hold the total number of files available on the record.
2	Downloaded Files	Specify an output fieldname to hold the total number of successfully downloaded files.
3	Overwritten Files	Specify an output fieldname to hold the total number of replaced/overwritten files.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

7.3 Remedy (REST): Input

7.3.1 Description

Remedy (REST): Input plugin step gets the records of a form with specified criteria on a Remedy server instance.

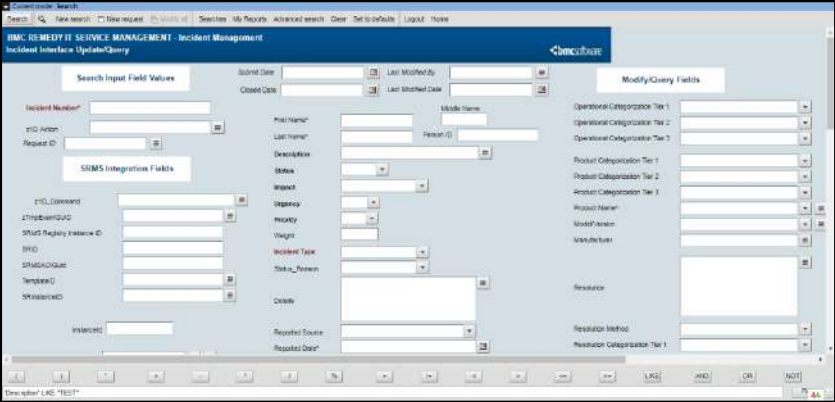

The step is used to search Remedy Applications like Incident Management, Change Management, Problem Management, People Management and others. For example Remedy Input can be used to query open incidents etc.

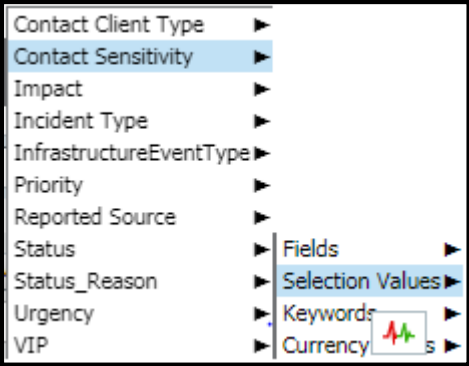

7.3.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	AE Server Base URL	Base URL of Remedy server (e.g. http://Server Name or IP:port where Port is the Remedy REST API port). The default REST API port is 8008. This field is mandatory.
3	User Name	Specify a username (Ex: - Allen) in the Remedy instance having permissions to authenticate and to search Record on Remedy server. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	Specify the password of the user to authenticate to Remedy Server. Password is encrypted and not stored in the .psw workflow file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
6	Button: Test Connection	Test connection based on AE Server Base URL, Port number, username and password. All these fields are mandatory. Test connection button verifies whether the connection is available or not. Note: If the connection fields are provided from previous step, then Test Connection Button does not work.

Input Tab:

No.	Field Name	Description
1	Input Fields:	
2	Form Name	Double Click this field to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field. Form Name has to be chosen from the Form Explorer window. It will not work for the previous step fields; however Static Values can be provided. The form name is

		<p>validated on remedy server. (e.g. CTM:People, HPD:IncidentInterface, PBM:ProblemInterface, CHG:ChangeInterface etc. Users can perform a Search on any form according to the permissions.) Once a form is chosen the Criteria field is enabled. Provide a criteria and its value.</p>
3	<p>Button: Get Forms</p>	<p>Click this button to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field.</p>
4	<p>Criteria Query</p>	<p>Provide criteria for the search. Records present on the Remedy server will be fetched as per the provided criteria query. e.g. on CTM:People there could be a criteria query :- 'First Name'="test3" AND 'Last Name'="sk" e.g. on HPD:IncidentInterface there could be a criteria query:- 'First_Name'="test3" Query Criteria in BMC Remedy can be built by navigating to the Advanced Search on the form on which search is being conducted. The following is a screenshot of HPD:IncidentInterface in Advanced search. On the bottom row you can see the operators that can be used in Criteria Query.</p>  <p>On the bottom Right you may click the Fields button. You have the options to select Fields, Selection Values (List of Values), Keywords and currency as part of query building.</p>

		 <p>Query built in BMC Remedy forms can be used in Criteria Query field of this plugin. However, make modifications as follows. Please Note: that elements on the left of the operator should be in single quotes and elements on the right should be in double quotes. Any * associated with mandatory fields should be removed before using the Remedy Query in the Criteria Query field.</p>
5	Fetch Records Batch Size	Specify a batch size to fetch records. The default value is 10. Input step will give the output depending on the criteria query on the specified form. By this provision it will fetch the records in the provided batches.
Output Tab:		
No.	Field Name	Description
1	Output Fields:	
2	Field Name	On double click in output table, fields associated with the form name will populate. The name of the fields to be fetched should be selected. Multiple fields can be selected from the list displayed on click. The selected field's values will be the output parameters of this plugin. Validation: The plugin validates field names from remedy server.
3	Field Value	Specify the name to the output field which holds the value of the fields selected.
Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.

		If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

7.4 Remedy (REST): Insert Record

7.4.1 Description

Remedy (REST): Insert Record plugin step creates a new record on the provided form name by inserting the field values provided on the specified Remedy Server instance.

The step is used to insert records in Remedy Applications like Incident Management, Change Management, Problem Management, People Management and others. For example Remedy Insert can be used to create an incident.

7.4.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	AE Server Base URL	Base URL of Remedy server (e.g. Error! Hyperlink reference not valid. where Port is the Remedy REST API port). The default REST API port is 8008. This field is mandatory.
3	User Name	Specify a username (Ex: - Allen) in the Remedy instance having permissions to authenticate and to search Record on Remedy server. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	Specify the password of the user to authenticate to Remedy Server. Password is encrypted and not stored in the .psw workflow file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.

6	Button: Test Connection	<p>Test connection based on AE Server Base URL, Port number, username and password. All these fields are mandatory. Test connection button verifies whether the connection is available or not.</p> <p>Note: If the connection fields are provided from previous step, then Test Connection Button does not work.</p>
Input Tab:		
No.	Field Name	Description
1	Input Fields:	
2	Form Name	<p>Double Click this field to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field. Form Name has to be chosen from the Form Explorer window. It will not work for the previous step fields; however Static Values can be provided. (e.g. HPD: IncidentInterface_Create, PBM: ProblemInterface_Create, CHG: ChangeInterface_Create, CTM: People etc. Users can insert into any form according to the permissions.)</p>
3	Button: Get Forms	<p>Click this button to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field.</p>
5	Accept Fields as JSON	<p>Enable checkbox to accept field names as JSON input.</p>
6	JSON	<p>If 'Accept Fields as JSON' checkbox is enabled this field is activated. Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes (“”) enclosure. Provide all the required or mandatory fields as well as other fields to be inserted as keys in the JSON.</p> <p>Note: The JSON could be from any input step such as Generate rows, Text File input, Excel Input et al. In Remedy REST steps JSON text can only be accepted from input fields from previous steps and not as files directly.</p> <p>Sample JSON text for inserting a single Knowledge Article record:</p> <p>Following is a sample JSON for inserting a record in Knowledge Article form. This JSON text has five key-value pairs denoting fields and their values to populate five fields. In this Cherwell instance Service and Title are mandatory for Knowledge Article Business Object.</p> <p>Note: Lookup field values must exactly match existing values in the Cherwell instance.</p> <p>Sample JSON text for inserting an Incident record:</p>

		<p>Following is a sample JSON for inserting a record in Incident form. This JSON text has eight key-value pairs denoting fields and their values to populate eight fields. Lookup field values must exactly match existing values in the Remedy instance. In this Remedy instance for Incident creation, First_Name, Last_Name, Service Type, Status, Impact, Urgency, Description and Reported Source are mandatory.</p> <p>e.g. on HPD:IncidentInterface there could be JSON field as shown below where field JSON_Inc is coming from the input stream such as a field in Generate Rows, CSV etc.</p> <div data-bbox="641 562 1468 646" style="border: 1px solid black; padding: 5px;"> <p>Form Name: HPD:IncidentInterface_Create Get Forms</p> <p>Accept fields as JSON <input checked="" type="checkbox"/></p> <p>JSON: JSON_Inc Ⓢ</p> </div> <p>Sample value of JSON_Inc:</p> <pre>{"Description":"Test_Incident_25072019","Impact":"2-Significant/Large","Urgency":"2-High","Service_Type":"User Service Request","First_Name":"Taufeek","Last_Name":"Kureshi","Status":"New","Reported Source":"Direct Input"}</pre> <p>Sample JSON text for inserting a People record:</p> <p>Following is a sample JSON for inserting a record in People form. This JSON text has five key-value pairs denoting fields and their values to populate five fields. Lookup field values must exactly match existing values in the Remedy instance. In this Remedy instance for People, Company, Last Name, First Name, Client Type, Phone Number Business are mandatory.</p> <p>e.g. on CTM:People there could be JSON field as shown below, where field JSON1 is coming from the input stream such as a field in Generate Rows, CSV etc.</p> <div data-bbox="641 1171 1446 1283" style="border: 1px solid black; padding: 5px;"> <p>Form Name: CTM:People Get Forms</p> <p>Accept fields as JSON <input checked="" type="checkbox"/></p> <p>JSON: JSON1 Ⓢ</p> </div> <p>Sample value of JSON1:</p> <pre>{"First Name":"Thomas","Last Name":"Astebro","Client Type":"Office-Based Employee","Company":"Calbro Services","Phone Number Business":"9999999999"}</pre>
	Table Fields:	
7	Variable Field Name	This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.
8	Static Field Name	<p>On click of this column field, it opens a dialog with the list of available form fields of the provided Form Name.</p> <p>The name of the fields to be inserted should be selected.</p> <p>Multiple fields can be selected from the list displayed on click.</p> <p>The selected field's values below will be inserted in the record.</p> <p>Validation: The plugin validates field names from remedy server.</p>

9 Field Value

Provide field values to be inserted in the corresponding chosen fields.
 Following, is a sample snapshot of input tab with Table Fields with Static Field Name.

Form Name	HPD:IncidentInterface_Create			
Accept fields as JSON	<input type="checkbox"/>			
JSON				
Table Fields	#	Variable Field Name	Static Field Name	Field Value
	1		First_Name	Xxxxxxx
	2		Last_Name	Zzzzzzz
	3		Description	Test for Demo12345
	4		Service_Type	User Service Request
	5		Impact	4-Minor/Localized
	6		Urgency	4-Low
	7		Reported Source	Direct Input

Following, is a sample snapshot of input tab with Table Fields with Variable Field Name.

Form Name	HPD:IncidentInterface_Create			
Accept fields as JSON	<input type="checkbox"/>			
JSON				
Table Fields	#	Variable Field Name	Static Field Name	Field Value
	1	\${LastName}		Xxxxxxxx
	2	\${Urgency}		3-Medium
	3	\${Status}		New
	4	\${ServiceType}		User Service Request
	5	\${ReportedSource}		Direct Input
	6	\${Impact}		3-Moderate/Limited
	7	\${Description}		Test for variable input type

Output Tab:

No.	Field Name	Description
	Output Fields:	
1	Record Location	Specify an output field to hold the location value of the record.
2	Generated Requested ID	Specify an output field to hold the Generated Request ID of the inserted record.

Common Buttons:

No.	Field Name	Description
	Buttons:	

1	OK	<p>On click of this button. It will check the field values. If any required field values are missing then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	On click of this button, it will cancel the window and do not save any values

7.5 Remedy (REST): Update Record

7.5.1 Description

Remedy (REST): Update Record plugin step updates a single record in the specified form name with field values provided on a Remedy Server instance.

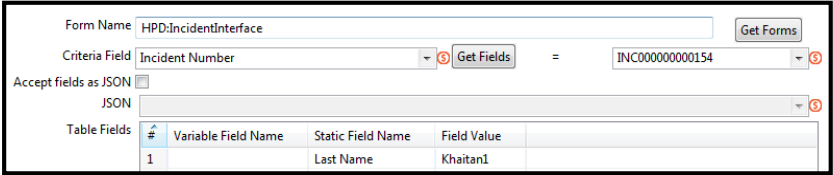

The step is used to update Remedy Applications like Incident Management, Change Management, Problem Management, People Management and others. For example, Remedy Update Record can be used to close a ticket if resolved.

7.5.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	AE Server Base URL	Base URL of Remedy server (e.g. e.g. http://Server Name or IP:port. where Port is the Remedy REST API port). The default REST API port is 8008. This field is mandatory.
3	User Name	The username having permission to login to Remedy Server (Ex: - Allen). This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	<p>Specify the password of the user to authenticate to Remedy Server. Password is encrypted and not stored in the .psw workflow file.</p> <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p>

		If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
	Button:	
6	Test Connection	Test connection based on AE Server Base URL, Port number, username and password. All these fields are mandatory. Test connection button verifies whether the connection is available or not. Note: If the connection fields are provided from previous step, then Test Connection Button does not work.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Form Name	Double Click this field to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field. Form Name can be chosen from the Form Explorer window. It will not work for the previous step fields; however Static Values and Environment Variables can be provided (e.g. CTM:People, HPD:IncidentInterface, PBM:ProblemInterface, CHG:ChangeInterface etc. Users can update records on any form according to the permissions).
2	Button: Get Forms	Click this button to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field.
3	Criteria Field	Double click this field to open the Field Explorer window. Select form field names to set Criteria Field. Criteria Field has to be chosen from the Field Explorer window. It will not work for the previous step fields; however Static Values and Environment Variables can also be provided.
4	Button: Get Fields	Click this button to open the Field Explorer window. Select a Criteria form field from the list.
5	Criteria Field Value	Provide a value for the Criteria Field chosen above.
6	Accept Fields as JSON	Enable checkbox to accept field names as JSON input.
7	JSON	If 'Accept Fields as JSON' checkbox is enabled this field is activated. Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes ("")

		<p>enclosure. Provide all the required or mandatory fields as well as other fields to be inserted as as keys in the JSON.</p> <p>Note: The JSON could be from any input step such as Generate rows, Text File input, Excel Input etc. In Remedy (REST) steps JSON text can only be accepted from input fields from previous steps and not as files directly.</p> <p>Sample JSON text for updating an Incident record: Following is a sample JSON for updating a record in Incident form. Provide key-value pairs in the JSON text denoting the fields to be updated and the new values for the record.</p> <p>Note: Lookup field values must exactly match existing values in the Remedy instance.</p> <p>For e.g. if Last_Name is to be updated in HPD:IncidentInterface create a JSON field with value: {"Last Name":"Khaitan"}</p>
	Table Fields:	
8	Variable Field Name	This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.
9	Static Field Name	<p>On click of this column field, it opens a dialog with the list of available form fields of the provided Form Name.</p> <p>The name of the fields to be inserted should be selected.</p> <p>Multiple fields can be selected from the list displayed on click.</p> <p>The selected field's values below will be inserted in the form.</p>
10	Field Value	<p>Provide field values to be inserted in the corresponding chosen fields.</p> <p>Following, is a sample snapshot of input tab with Table fields populated.</p> <p>Following, is a sample snapshot of input tab with Table Fields with Static Field Name. You may also provide variables in Variable Field Name instead of Static Field Name.</p> 

Output Tab:

No.	Field Name	Description
	Output Fields:	
1	Updated Record Id	Specify an output field to hold the Record Id of the updated record as a result of the step execution.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

7.6 Remedy (REST): Upload Attachment

7.6.1 Description

Remedy (REST): Upload Attachment plugin step uploads an attachment to specified form and record in a Remedy Server instance.

The step is used to upload attachments to records of Remedy Applications like Incident Management, Change Management, Problem Management and others. Users can upload attachments to records of any form according to the permissions and provision in the form for attachments.

7.6.2 Configurations

No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
1	AE Server Base URL	Base URL of Remedy server (e.g. http://Server Name or IP:port where Port is the Remedy REST API port). The default REST API port is 8008. This field is mandatory.
	User Name	The username having permission to login to Remedy Server and upload an attachment (e.g - Allen). This field is mandatory.
	Password:	

4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	<p>Specify the password of the user to authenticate to Remedy Server. Password is encrypted and not stored in the .psw workflow file.</p> <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
	Button:	
4	Test Connection	<p>Test connection based on AE Server Base URL, Port number, username and password. All these fields are mandatory. Test connection button verifies whether the connection is available or not.</p> <p>Note: If the connection fields are provided from previous step, then Test Connection Button does not work.</p>

Input Tab:		
No.	Field Name	Description
1	Input Fields:	
2	Form Name	Double Click this field to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field. Form Name can be chosen from the Form Explorer window. It will not work for the previous step fields; however Static Values and Environment Variables can be provided (e.g HPD:WorkLog, PBM:Investigation WorkLog, CHG:WorkLog etc. Users can upload attachments to records of any form according to the permissions.).
3	Button: Get Forms	Click this button to open a Form Explorer window with a list of Remedy forms. Choose a form from the list to populate the Form Name field.
4	Criteria Field	Double click this field to open the Field Explorer window. Select form field names to set Criteria Field.

		Criteria Field has to be chosen from the Field Explorer window. It does not work for the previous step fields; however Static Values can be provided.
5	Button: Get Fields	Click this button to open the Field Explorer window. Select a Criteria form field from the list.
6	Criteria Field Value	Provide a valid value for the Criteria Field chosen above.
7	Attachment Field Name	On double click of this field, if connection is successfully established populates list of attachment fields/placeholders names associated with the Form name on the Remedy Server.
8	Get	On click of this button, if connection is successfully established , it populates list of attachment field's name on the Remedy Server
9	Input File Path	The absolute file path has to be given where the attachment has to be stored.
10	Browse File	Click to get absolute path of desired target file.

Output Tab:

No.	Field Name	Description
	Output Fields:	
1	Attachment Uploaded to Record	Specify an output field to hold the Record Id of record to which an attachment has been uploaded as a result of step execution.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

8 CAPTCHA

CAPTCHA Plugin resolves CAPTCHA using 'Death By Captcha' service. 'Death By Captcha' may be referred to as DBC at times in this document.

Sometimes CAPTCHA may not get resolved, this may be due to incorrect response from 'Death By Captcha' service. If you observe such issue frequently, then please contact 'Death By Captcha' support.

8.1 DBC: Image

8.1.1 Description

DBC: Image is a step in the Utility Plugin. DBC: Image workflow step retrieves the text from a word CAPTCHA image. It uses 'Death By Captcha' (DBC) REST APIs to resolve CAPTCHA text. User needs to have DBC: Image account in order to use their services. The DBC REST API base URL is <http://api.dbcapi.me/api/captcha>.

8.1.2 Description

General Tab:		
No.	Field Name	Description
	DBC Account Details:	
1	URL	Specify the REST API http URL of your DBC account (http://api.dbcapi.me/api/captcha).
2	Username	Specify the username of your DBC account.
3	Password	Specify the password.
	Input:	
1	Captcha image filepath	CAPTCHA image file path. The data type is String. This field is mandatory.
2	Button: Browse	Click Browse button to select CAPTCHA image file. The supported image formats are JPG, PNG, GIF and BMP.
	Retry if DBC Service is Temporarily Unavailable:	
3	Retry Count	Specify Number of times the server is expected to retry if the DBC service is temporarily unavailable. The data type is integer. The default value of Retry Count is 5. Note: When the DBC service is temporarily unavailable, the value in the 'Retry Count' field specifies the number of times the server should retry uploading the image and calling the API after every specified interval in seconds.
4	Retry Interval in Seconds	Specify a Retry time interval (in seconds) between every retry attempt (Polling repeat interval) in case DBC server is temporarily unavailable or CAPTCHA is not resolved. The data type is integer. The default value is 2.

		<p>Note: If at first attempt, the API fails to retrieve the CAPTCHA text i.e. the result returned by the API is blank, it will internally retry polling for maximum of 10 times after every specified interval in seconds until it gets the CAPTCHA text.</p>
	Output:	
1	Captcha Output	Output field to hold the resolved CAPTCHA text.

List of Validations:

Sr. No.	Validation
1	CAPTCHA image file should be of one of the supported formats i.e. JPG, PNG, GIF and BMP
2	CAPTCHA image file size is limited to less than 180 KB
4	Minimum Retry Interval should not be less than 2 seconds.
5	Execution should fail if CAPTCHA is not yet resolved after polling 10 times with specified Interval in Seconds

8.2 DBC: reCAPTCHA v2 Checkbox

8.2.1 Description

DBC: reCAPTCHA v2 Checkbox step, gets the token to solve reCAPTCHA v2 Checkbox.

References:

- How to use token to solve reCAPTCHA
<https://www.deathbycaptcha.com/user/api/newtokenrecaptcha>

Note:s:

- To solve reCAPTCHA pass the Token Text received in response, to an Inject JavaScript step to complete action of handling the output Token to process reCAPTCHA.

8.2.2 Description

General Tab:		
No.	Field Name	Description
	DBC Account Details:	
1	URL	Specify the REST API http URL of your DBC account 'Death By Captcha' API URL (http://api.dbcapi.me/api/captcha). The URL is defined in the field and is non-editable.
2	Username	Specify the username of your DBC account.

	Password:	
3	Accept value as variable/static	Enable checkbox for Password field to appear as Text box. Else, leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list.
4	Password	Specify the password of the DBC account. If checkbox above is enabled Password field appears as Text box to enter password. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. The data type is String. This field is mandatory.

Input Tab		
No.	Field Name	Description
	Input Fields:	
1	Page URL	Specify URL of the page on which the re CAPTCHA with Checkbox is to be resolved. The data type of the field is String. This field is mandatory.
2	Site Key	Site Key is a web-based security system, which provides a type of mutual authentication between end-users and websites. Its primary purpose is to deter phishing. The data type of the field is String. This field is mandatory. Fetch data-sitekey or sitekey from page source (by right clicking on web page and click to view page source).
Retry if DBC Service is temporarily unavailable:		
3	Max Retry Count	Max Retry Count is used for- <ul style="list-style-type: none"> • When the DBC service is temporarily unavailable • When API fails to retrieve the output i.e token text If the value is not provided or less than 10, then it will retry for maximum 10 times internally. The data type of the field is Integer. This field is optional. The default value is 10.
4	Retry Interval (seconds)	Time interval (in seconds) between every retry attempt (Polling repeat interval). If value is not provided, default value 2 is considered. Minimum Retry Interval should not be less than 2 seconds. The data type of the field is integer. This field is optional.

Output Tab

No.	Field Name	Description
	Token Text:	
1	Token Text	<p>Specify an output field to hold the retrieved token text on successful plugin execution. Default label value for this field is "TokenText".</p> <p>Steps to handle Token Text to resolve reCAPTCHA with Checkbox:</p> <ul style="list-style-type: none"> In the following JavaScript code substitute <'Paste String here'> with the Token Text, <pre>document.getElementById('g-recaptcha-response').innerHTML=<'Paste String here'>; document.forms[0].submit();</pre> <p>Manual Steps:</p> <ul style="list-style-type: none"> You need to right click on Page URL and click Inspect. On the Inspect page navigate to the Console tab and paste this code and Enter. This enables the CAPTCHA checkbox. <p>However, this is a manual activity. Hence you may create a workflow to automate this activity as mentioned in the next point.</p> <p>Automation:</p> <ul style="list-style-type: none"> After the reCAPTCHA v2 Checkbox step in the workflow you may put, <ul style="list-style-type: none"> A single Plugin step → Inject Java Script. with the above JavaScript in an Inject JavaScript step or else, A combination of RPA Plugin steps to right click and inspect the page → set the JavaScript code above as a variable in Modified Java Script step → Web Set Value on console and → Press Enter with Robot Handling step.

Common Buttons:

No.	Field Name	Description
	Buttons:	

1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

8.3 DBC: reCAPTCHA v3

8.3.1 Description

DBC: reCAPTCHA v3 step gets the token to solve reCAPTCHA v3.

Note:s:

- How to use token to solve reCAPTCHA
<https://www.deathbycaptcha.com/user/api/newtokenrecaptcha>
- To solve reCAPTCHA using plugin step pass the Token Text received in response to - Inject JavaScript step and complete action.

8.3.2 Description

General Tab:		
No.	Field Name	Description
	DBC Account Details:	
1	URL	'Death By Captcha' API URL (http://api.dbcapi.me/api/captcha). The URL is defined in the field and the value is non- editable.
2	Username	Specify the username of your DBC account.
	Password:	
3	Accept value as variable/static	Enable checkbox for Password field to appear as Text box. Else, leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list.
4	Password	Specify the password. If checkbox above is enabled Password field appears as Text box to enter password. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. This field is mandatory.

Input Tab		
No.	Field Name	Description

	Input Fields:	
1	Page URL	Specify URL of the page on which the reCAPTCHA is to be resolved. The data type of the field is String. This field is mandatory.
2	Site Key	Site Key is a web-based security system, which provides a type of mutual authentication between end-users and websites. Its primary purpose is to deter phishing. The data type of the field is String. This field is mandatory. Fetch data-sitekey or sitekey from page source (right clicking on web page and click to view page source).
3	Action	The action parameter at reCAPTCHA v3 is additional data used to separate different CAPTCHA validations like login, register, sales, etc. The data type of the field is String. This field is mandatory. Action value can be obtained from page source. It is the Action associated with the data-sitekey/sitekey
4	Min. Score	The minimal score needed for the CAPTCHA resolution. We recommend using the 0.3 min-score value, scores higher than 0.3 are hard to get. The data type of the field is String. This field is mandatory.
Retry if DBC Service is temporarily unavailable:		
3	Max Retry Count	Max Retry Count is used for- <ul style="list-style-type: none"> When the DBC service is temporarily unavailable When API fails to retrieve the output i.e token text If the value is not provided or less than 10, then it will retry for maximum 10 times internally. The data type of the field is Integer. This field is optional. The default value is 10.
4	Retry Interval (seconds)	Time interval (in seconds) between every retry attempt (Polling repeat interval). If value is not provided, default value '2' will be considered. The data type of the field is integer. This field is optional. The default value is 2. Minimum Retry Interval should not be less than 2 seconds.

9 Cherwell

Cherwell plugin has several steps for operations on Cherwell.

Compatibility: Cherwell plugin steps have been tested on Cherwell Version 9.4

Prerequisites:

- Services of the Cherwell Server must be up and running.
- Access Cherwell instance using REST APIs from Process Studio/AE agent machine.
- Cherwell Server settings:

When Cherwell REST APIs are called simultaneously, due to multiple requests with the same username, password and api key, the API starts giving 'invalid_grant: badrequest' error.

To handle this error, add highlighted line in the web.conig file of CherwellAPI.

```
<appSettings>
<add key="DisableMessageThrottling" value="true" />
<add key="TrebuchetDataSource" value="[Common]Cherwell Browser" />
<add key="SamlBaseUri" value="your web api base uri(https://domain/CherwellApi" />
</appSettings>
```

Error Message Display Properties when run with Process Studio:

- i. All the validation messages are displayed as pop up and runtime error messages are recorded in the logging tab.
- ii. The pop up box is configured to be displayed as Message Box not as Error Dialog box.
- iii. The error messages at runtime are displayed in the logging tab of Process Studio in red color.
- iv. For Successful validation the Message Box title is "Success" and the result message in the body.
- v. For Failed validation message the Message Box title is "Failure" and the failed message is in the body.
- vi. The plugin throws error at run time if invalid query is provided.

9.1 Cherwell: Delete Record

9.1.1 Description

Cherwell Delete Record step is used to delete records in Cherwell Business Objects (Forms) (For example close an incident if it is resolved or to keep a ticket open if not resolved yet).

9.1.2 Configurations

Connection:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
2	URL	Base URL of Cherwell. This field is mandatory.

3	User Name	Cherwell username. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	<p>Provide the Cherwell Password for the user. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
6	Client ID	<p>Provide a Cherwell Client ID. Client ID is used to communicate to Cherwell instance. This field is mandatory.</p> <p>Note: CSM Administrator (Orange client) and CSM client (Blue client) tools can be installed for administration and development purposes. Generate a Cherwell client ID from Orange Client using the navigation, CSM Administrator tool→Security → REST API clients.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not. Base URL, Username, Password, Client ID fields are mandatory. If no values are provided or some values are missing, then it will display the validation error message.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>

Input Fields:

No.	Field Name	Description
1	Form Name	Specify the Cherwell form name/Business Object from which the record details will be fetched. This field is mandatory.

2	Button: Get Forms	<p>On click of this button, it populates the forms of the connected Cherwell Server depending on Access/Permissions of the user. If any required field values are missing, then it will display validation error message.</p> <p>Select a form to populate it into the Form Name field.</p>
3	Business Object Public ID/RecID	Cherwell Business Object PublicID/RecID. This field is mandatory.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	<p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	On click of this button, it will cancel the window and do not save any values

Result:

There is no explicit output Result field in this plugin. Plugin results weather success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in [Appendix 1: Error Handling in IT Plugins](#) to make the error message visible on AutomationEdge Requests.

9.2 Cherwell: Download Attachment

9.2.1 Description

Cherwell Download Attachment step is used to download attachments from Cherwell Business Objects (Forms) on a provided Business Object Rec ID or Public ID. (For example close an incident if it is resolved or to keep a ticket open if not resolved yet).

9.2.2 Configurations

Connection:		
No.	Field Name	Description

1	Step Name	Name of the step. This name has to be unique in a single workflow.
2	URL	Specify URL to access Cherwell. This field is mandatory.
3	User Name	Cherwell username. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	<p>Provide the Cherwell Password for the user. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
6	Client ID	<p>Provide a Cherwell Client ID. Client ID is used to communicate to Cherwell instance. This field is mandatory.</p> <p>Note: CSM Administrator (Orange client) and CSM client (Blue client) tools can be installed for administration and development purposes. Generate a Cherwell client ID from Orange Client using the navigation, CSM Administrator tool → Security → REST API clients.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not. Base URL, Username, Password, Client ID fields are mandatory. If no values are provided or some values are missing, then it will display the validation error message.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>

Input Fields:		
No.	Field Name	Description
1	Form Name	This holds the Cherwell form name from which the record details will be fetched. This field is mandatory.

2	Button: Get Forms	On click of this button, it populates the forms of connected Cherwell Server depending on Access/Permissions of the user. If any required field values are missing, then it will display validation error message. Select a form to populate it into the Form Name field.
3	Business Object Public ID/RecID	Cherwell Business Object PublicID/RecID. This field is mandatory.
4	Output Folder Path	Specify a folder path where files are to be downloaded or browse for a folder using the Browse File... button. Alternatively, when the folder path is coming from an input stream, you may select the field containing the folder path from the drop down list
5	Button: Browse Folder	This is the button to browse for a folder to download to a Cherwell Business Object file.
6	Delete Output Folder Contents before downloading	Allowed values: 'Yes', 'No'. Specify Yes to delete output folder contents before downloading else Specify No.
7	Add Date TimeStamp for Duplicate Files	Allowed values: 'Yes', 'No'. Specify Yes to add Date TimeStamp for Duplicate Files.
8	Add File To Result	Allowed values: 'Yes', 'No'. Specify Yes to add file to result set and display download link on AE otherwise else select No.

Output Tab:

No.	Field Name	Description
1	Total Files	Specify a field name to store the total number of files in the Cherwell Business Object. This field is mandatory.
2	Downloaded Files	Specify a field name to store the number of Downloaded Files. This field is mandatory.
3	Overwritten Files	Specify a field name to store the number of Overwritten Files in the output folder. This field is mandatory.

Result:

There is no explicit output Result field in this plugin. Plugin results weather success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in [Appendix 1: Error Handling in IT Plugins](#) to make the error message visible on AutomationEdge Requests.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

9.3 Cherwell: Input

9.3.1 Description

Cherwell input step gets Cherwell records based on the form name and query criteria provided. It returns the form field values for fields specified in the output Field Name.

9.3.2 Configurations

Connection:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
2	URL	Specify URL to access Cherwell. This field is mandatory.
3	Username	Cherwell username. This field is mandatory.
4	Password	Provide the Cherwell Password for the user. Password field value is encrypted (*****) and also stored in encrypted format in the psw file. This field is mandatory.
5	Client ID	Provide a Cherwell Client ID. Client ID is used to communicate to Cherwell instance. This field is mandatory. Note: CSM Administrator (Orange client) and CSM client (Blue client) tools can be installed for administration and development purposes. Generate a Cherwell client ID from Orange Client using the navigation, CSM Administrator tool → Security → REST API clients.
6	Button: Test Connection	Verifies whether the connection is available or not.

	<p>URL, Username, Password, Client ID fields are mandatory. If no values are provided or some values are missing, then it will display the validation error message.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>
--	--

Input Fields:

No.	Field Name	Description
1	Form Name	This holds the Cherwell Form/Business Object/ for which the record details will be fetched. This field is mandatory.
2	Button: Get Forms	<p>On click of this button, it populates the forms of connected Cherwell Server depending on Access/Permissions of the user. If any required field values are missing, then it will display validation error message.</p> <p>Select a form to populate it into the Form Name field.</p>
3	Criteria Query	<p>Specify the criteria query in json format. Following, is a sample json with two conditions. The first condition is 'Status' equals (eq) 'Assigned' and the second statement is 'Created Date Time' later than(It) '6/20/2016 8:59:17 PM'.</p> <pre>[{ "displayName": "Status","operator": "eq","value": "Assigned" }, { "displayName": "Created Date Time","operator": "lt","value": "6/20/2016 8:59:17 PM" }]</pre> <p>This criteria query will filter rows fulfilling the two conditions below.</p>
4	Fetch Records Batch Size	Default Records Batch Size is 10. Specify the batch size to fetch records. These fetched records in the batch are then available to the next step in workflow while the next batch is being fetched in this step. Thus, parallel execution of records is achieved. This should be a positive number.
5	Get Top N Records	Specify the number of latest records to be fetched.

Output Fields:

No.	Field Name	Description
	Output Fields:	
1	Field Name	The name of the fields fetched from the business object as per Criteria Query. On click of this column field, it will open a dialog with the list of available form fields of the provided Business Object Name.
2	Output Field	Specify an output field name for containing Cherwell field values.
3	Get HTML	Select Yes/No from the Drop down list. If a field in a Business object accepts Rich Text Format (RTF) input (Text and images) then such input is stored in HTML format internally. To fetch the stored content in RTF (in html format) you may select Yes. If Yes is selected for fields that do not have RTF input, it returns null. Some examples of business object fields accepting RTF input are, Incident: Description, Change: Description, Problem: Description, Knowledge Article: Body Text.
Result:		
There is no explicit output Result field in this plugin. Plugin results whether success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in Appendix 1: Error Handling in IT Plugins to make the error message visible on AutomationEdge Requests.		

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

9.4 Cherwell: Insert Record

9.4.1 Description

Cherwell Insert record step is used to create a record in a particular Cherwell Business Object (Form). It creates a new record with for the provided form name and field values on specified Cherwell Server. It returns the Public ID/RecID and Result as output.

9.4.2 Configurations

Connection:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
2	URL	Specify URL to access Cherwell. This field is mandatory.
3	User Name	Cherwell username. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	Provide the Cherwell Password for the user. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
6	Client ID	Provide a Cherwell Client ID. Client ID is used to communicate to Cherwell instance. This field is mandatory. Note: CSM Administrator (Orange client) and CSM client (Blue client) tools can be installed for administration and development purposes. Generate a Cherwell client ID from Orange Client using the navigation, CSM Administrator tool → Security → REST API clients.
7	Button: Test Connection	Verifies whether the connection is available or not. Base URL, Username, Password, Client ID fields are mandatory. If no values are provided or some values are missing then it will display the validation error message. Note: For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.

Input Fields:		
No.	Field Name	Description
1	Form Name	This holds the Cherwell form name from which the record details will be fetched. This field is mandatory.
2	Button: Get Forms	<p>On click of this button, it populates the forms of connected Cherwell Server depending on Access/Permissions of the user. If any required field values are missing then it will display validation error message.</p> <p>Select a form to populate it into the Form Name field.</p>
3	Accept Fields as JSON	Enable checkbox to accept field names as JSON input.
4	JSON	<p>If 'Accept Fields as JSON' checkbox is enabled this field is activated. Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes (“”) enclosure. Provide all the required or mandatory fields as well as other fields to be inserted as as keys in the JSON.</p> <p>Note: The JSON could be from any input step such as Generate rows, Text File input, Excel Input Et al. In Cherwell steps JSON text can only be accepted from input fields from previous steps and not as files directly.</p> <p>Sample JSON text for inserting a single Knowledge Article record:</p> <p>Following is a sample JSON for inserting a record in Knowledge Article form. This JSON text has five key-value pairs denoting fields and their values to populate five fields. In this Cherwell instance Service and Title are mandatory for Knowledge Article Business Object.</p> <p>Note: Lookup field values must exactly match existing values in the Cherwell instance.</p> <p>JSON text:</p> <pre>[{ "displayName": "Service", "value": "IT Service Desk" }, { "displayName": "Title", "value": "Test_KA5" }, { "displayName": "Category", "value": "Request Help" },]</pre>

```
{
  "displayName": "SubCategory",
  "value": "Submit Service Request"
},
{
  "displayName": "Keywords",
  "value": "Test for KA"
},
{
  "displayName": "Visible to Customer Portal",
  "value": "False"
},
{
  "displayName": "Article Type",
  "value": "How To"
}
}
```

Sample JSON text for inserting an Incident record:

Following is a sample JSON for inserting a record in Incident form. This JSON text has five key-value pairs denoting fields and their values to populate three fields. In this Cherwell instance Description, Short Description, Priority, Owned By and Customer ID are mandatory for Incident Business Object.

Note: Lookup field values must exactly match existing values in the Cherwell instance.

```
[
  {
    "displayName": "Description",
    "value": " Computer is Slow "
  },
  {
    "displayName": "Short Description",
    "value": " Cannot open office applications "
  },
  {
    "displayName": "Priority",
    "value": "1"
  },
  {
    "displayName": "Owned By",
    "value": "Andrew"
  },
  {
    "displayName": "Customer ID",
    "value": "123"
  }
]
```

]
	Table Fields:	
5	Variable Field Name	This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.
6	Static Field Name	On click of this column field, it opens a dialog with the list of available form fields of the provided Form Name. The name of the fields to be inserted should be selected. Multiple fields can be selected from the list displayed on click. The selected field's values below will be inserted in the Business object form.
7	Field Value	Provide field values to be inserted in the corresponding chosen fields.

Output Tab:

No.	Field Name	Description
1	RecID	Specify a field name to return the RecID created with the input fields and field values provided. This field is mandatory.
2	Public ID	Specify a field name to return the Business Object Public ID created with the input fields and field values provided. This field is mandatory.

Result:

There is no explicit output Result field in this plugin. Plugin results weather success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in [Appendix 1: Error Handling in IT Plugins](#) to make the error message visible on AutomationEdge Requests.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.

2	Cancel	On click of this button, it will cancel the window and do not save any values
---	--------	---

9.5 Cherwell: Update Record

9.5.1 Description

Cherwell Update Record is used to update Cherwell Business Objects (Forms). For example, Cherwell Update record may be used to update an incident (i.e. to close an incident if resolved or to keep an incident open if not resolved yet).

9.5.2 Configurations

Connection:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
2	URL	Specify URL to access Cherwell. This field is mandatory.
3	User Name	Cherwell username. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	Provide the Cherwell Password for the user. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password field appears as Text Var. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
6	Client ID	Provide a Cherwell Client ID. Client ID is used to communicate to Cherwell instance. This field is mandatory. Note: CSM Administrator (Orange client) and CSM client (Blue client) tools can be installed for administration and development purposes. Generate a Cherwell client ID from Orange Client using the navigation, CSM Administrator tool → Security → REST API clients.
7	Button: Test Connection	Verifies whether the connection is available or not.

	<p>Base URL, Username, Password, Client ID fields are mandatory. If no values are provided or some values are missing, then it will display the validation error message.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>
--	---

Input Fields:

No.	Field Name	Description
1	Form Name	This holds the Cherwell form name from which the record details will be fetched. This field is mandatory.
2	Button: Get Forms	<p>On click of this button, it populates the forms of connected Cherwell Server depending on Access/Permissions of the user. If any required field values are missing, then it will display validation error message.</p> <p>Select a form to populate it into the Form Name field.</p>
3	Business Object Public ID/RecID	Cherwell Business Object PublicID/RecID. This field is mandatory.
4	Accept Fields as JSON	Enable checkbox to accept field names as JSON input.
5	JSON	<p>About JSON text:</p> <p>If 'Accept Fields as JSON' checkbox is enabled, this field is activated. Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes (") enclosure. Provide all the required or mandatory fields as well as other fields to be inserted as as keys in the JSON.</p> <p>Note: The JSON could be from any input step such as Generate rows, Text File input, Excel Input Et al. In Cherwell steps JSON text can only be accepted from input fields from previous steps and not as files directly.</p> <p>Sample JSON text for inserting a single Knowledge Article record:</p> <p>Following is a sample JSON for inserting a record in Knowledge Article form. This JSON text has five key-value pairs denoting fields and their values to populate five fields. In this Cherwell instance Service and Title are mandatory for Knowledge Article Business Object.</p>

Note: Lookup field values must exactly match existing values in the Cherwell instance.

JSON text:

```
[
  {
    "displayName": "Service",
    "value": "HR Service Desk"
  },
  {
    "displayName": "Title",
    "value": "Test_KA10"
  },
  {
    "displayName": "Category",
    "value": "Request leave Rules"
  },
  {
    "displayName": "SubCategory",
    "value": "Submit Service Request"
  },
  {
    "displayName": "Keywords",
    "value": "Test for KA"
  },
  {
    "displayName": "Visible to Customer Portal",
    "value": "False"
  },
  {
    "displayName": "Article Type",
    "value": "How To"
  }
]
```

Sample JSON text for updating an Incident record:

Following is a sample JSON for updating two records in Incident form. This JSON text has three key-value pairs denoting three fields and their values to update three fields. In this Cherwell instance Description, Short Description, Priority, Owned By and Customer ID are mandatory for Incident Business object.

Note: Lookup field values must exactly match existing values in the Cherwell instance.

```
[
  [
    {
      "displayName": "Description",
```

		<pre> "value": "Computer is Slow_updated" }, { "displayName": "Short Description", "value": "Cannot open office applications_updated" }, { "displayName": "Priority", "value": "1" }, { "displayName": "Owned By", "value": "Andrew" }, { "displayName": "Customer ID", "value": "123" }] </pre>
	Table Fields:	
1	Variable Field Name	This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.
2	Select Field Name	<p>On click of this column field, it opens a dialog with the list of available form fields of the provided Form Name.</p> <p>The name of the fields to be updated should be selected. Multiple fields can be selected from the list displayed on click. The selected field's values below will be updated in the Business object form.</p>
3	Field Value	Provide field values to be inserted in the corresponding chosen fields.

Result:
 There is no explicit output Result field in this plugin. Plugin results whether success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in [Appendix 1: Error Handling in IT Plugins](#) to make the error message visible on AutomationEdge Requests.

Common Buttons:		
No.	Field Name	Description
	Buttons:	

1	OK	<p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	On click of this button, it will cancel the window and do not save any values.

9.6 Cherwell: Upload Attachment

9.6.1 Description

Cherwell Upload Attachment step is used to upload a file to a Cherwell Business Object using the Public ID/ReclID.

9.6.2 Configurations

Connection:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
2	URL	Specify URL to access Cherwell. This field is mandatory.
3	User Name	Cherwell username. This field is mandatory.
	Password:	
4	Accept Value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
5	Password	<p>Provide the Cherwell Password for the user. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
6	Client ID	<p>Provide a Cherwell Client ID. Client ID is used to communicate to Cherwell instance. This field is mandatory.</p> <p>Note: CSM Administrator (Orange client) and CSM client (Blue client) tools can be installed for administration and development</p>

		<p>purposes. Generate a Cherwell client ID from Orange Client using the navigation, CSM Administrator tool → Security → REST API clients.</p>
7	Button: Test Connection	<p>Verifies whether the connection is available or not. Base URL, Username, Password, Client ID fields are mandatory. If no values are provided or some values are missing then it will display the validation error message.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.</p>

Input Fields:		
No.	Field Name	Description
1	Form Name	This holds the Cherwell form name from which the record details will be fetched. This field is mandatory.
2	Button: Get Forms	<p>On click of this button, it populates the forms of connected Cherwell Server depending on Access/Permissions of the user. If any required field values are missing, then it will display validation error message.</p> <p>Select a form to populate it into the Form Name field.</p>
3	Business Object Public ID/RecID	Cherwell Business Object PublicID/RecID. This field is mandatory.
4	File	Specify a file path to be uploaded may browse for a file using the Browse File... button. Alternatively, when the filename is coming from an input stream, you may select the field containing the filename from the drop down list.
5	Button: Browse File...	This is the button to browse a file to be uploaded to a Cherwell Business Object.

Result:
<p>There is no explicit output Result field in this plugin. Plugin results weather success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in Appendix 1: Error Handling in IT Plugins to make the error message visible on AutomationEdge Requests.</p>

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

10 Cognibot

10.1 Cognibot: Send Reply

10.1.1 Description

Cognibot: Send Reply plugin step sends the reply to Cognibot.

10.1.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Chatbot URL	Specify a valid chatbot URL. The field data type is String. This is mandatory.
3	Additional Information	Specify Valid additional information received from a chatbot. It is in JSON input, which can be configured from Cognibot or AI studio. The field data type is String. This is mandatory. For example: <pre> {"response_type": "chatbot", "conversation_details": {"chat_channel": "emulator", "service_url": "http://localhost:44209/v3/conversations/d14ee9c0-e099-11eb-bea8-256feff2f274 livechat/activities/abcd", "bot_id": "84ba24d0-e071-11eb-bea8-256feff2f274", "bot_name": "Bot", "user_id": "3a0eb962-d3e8-400a-b8e5-2023fd79f0ff", "user_name": "User", "conversation_id": "d14ee9c0-e099-11eb-bea8-256feff2f274 livechat"}} </pre>

4	Data	<p>Specify a valid JSON. JSON data which needs to be sent back to Chatbot.</p> <p>For example:</p> <pre>{ "details": { "even": true, "id": 1 } }</pre>
---	------	--

11 Docker

Use the Docker plugin steps for performing various actions on container and images in the Docker instance.

Note: For Docker installation and connection setup details, see [Appendix 19: Docker Installation and Connection Setup](#).

Prerequisites: Docker instance with access details.

United Tested with: AutomationEdge 7.1.1, Process Studio 7.1.1, Docker 20.10.12, Ubuntu 20.04 LTS

11.1 Docker: Commit Container

11.1.1 Description

Docker: Commit Container step is used to commit a container.

11.1.2 References

<https://docs.docker.com/engine/reference/commandline/commit/>

11.1.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker daemon is running.

		The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
8	Use Key	Select if you want to use the key. Allowed values are Yes or No.
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify a valid passphrase.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Username	Specify a valid proxy user name.
14	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
15	Docker Host URI	Select a valid Docker Host URI on which Docker Daemon is running. Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.
16	CA path (.pem)	Select a valid ca.pem (Certificate authority that signed) file path. Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.

17	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
18	Key Path (.pem)	Select valid Key.pem (Client key) file path.
19	Test Connection	<p>Verifies if the connection is established or not.</p> <p>Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Container ID/Name	Select the container ID or name. The field data type is String. This field is mandatory.
2	New Image Name	Select the image name. You can also provide a tag, such as ImageName:Tag
3	Author	Select the author. For example, "John Hannibal Smith <hannibal@a-team.com>")
4	Message	Select a commit message.
5	Pause	<p>Select Yes or No. Select Yes if you want to pause a container during image commit. Else, select No. Default value: Yes</p> <p>Note: The container is committed and its processes are paused while the image is committed, by default. This reduces the possibility of data corruption during the process of creating the commit. However, if you do not want to pause the container, set the pause option to No.</p>
6	Change in Dockerfile	<p>Apply Dockerfile instruction to the created image. You can provide multiple values using a semicolon. For example, "ENV DEBUG=true";"CMD ["apachectl", "-DFOREGROUND"]".</p> <p>Note:</p> <ul style="list-style-type: none"> The change in Dockerfile option will apply Dockerfile instructions to the image that is created. Supported Dockerfile instructions: CMD ENTRYPOINT ENV EXPOSE LABEL ONBUILD USER VOLUME WORKDIR Provide values in double-quotes separated by comma(,) or semicolon(;) for 'Change in Dockerfile'.

7	Max Wait For Response (Sec)	Specify the amount of time to wait for a response. The default value is 10 sec.
---	-----------------------------	---

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Image ID	Specify the Image ID field name. Default value: ImageID

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

11.2 Docker: Create Container

11.2.1 Description

Docker: Create Container step is used to create container.

11.2.2 References

<https://docs.docker.com/engine/reference/commandline/create/>

11.2.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker Daemon is running.

		The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
8	Use Key	Select if you want to use the key. Allowed values are Yes or No.
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify a valid passphrase.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Username	Specify a valid proxy user name.
14	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
15	Docker Host URI	Select a valid Docker Host URI on which Docker Daemon is running. Note: The Docker Host URI is not required, if you set the DOCKER_HOST.
16	CA path (.pem)	Select a valid ca.pem (Certificate authority that signed) file path. Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.

17	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
18	Key Path (.pem)	Select valid Key.pem (Client key) file path.
19	Test Connection	Verifies if the connection is established or not. Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Image ID/Name	Select the image ID or name. The field data type is String. This field is mandatory.
2	Command	This command is optional because the user who created the IMAGE may have already provided a default COMMAND using the Dockerfile CMD instruction. As the operator (the person running a container from the image), you can override that CMD instruction just by specifying a new COMMAND. If the image also specifies an ENTRYPOINT then the CMD or COMMAND get appended as arguments to the ENTRYPOINT.
3	Options/Flags	Provide valid options or flags to create a container. Click the following link to get a list of flags: https://docs.docker.com/engine/reference/commandline/create/#options Note: Provide flags in the following format: For example, <code>__domainname=abc --hostname=test --tty -i --env=foo=bar --health-cmd="ping google.com"</code>
4	Max Wait For Response (Sec)	Select the amount of time to wait for a response. The default value is 10 sec.

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Container ID	Specify the Container ID field name. Default value: ContainerID.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

11.3 Docker: Delete Container

11.3.1 Description

Docker: Delete Container step is used to delete the container.

11.3.2 References

<https://docs.docker.com/engine/reference/commandline/rm/>

11.3.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker Daemon is running. The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list.

		Else enable checkbox for Password field to appear as Text box.
7	Password	<p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
8	Use Key	Select if you want to use the key. Allowed values are Yes or No.
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify a valid passphrase.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.
14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
16	Docker Host URI	<p>Select a valid Docker Host URI on which Docker Daemon is running.</p> <p>Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.</p>
17	CA path (.pem)	<p>Select a valid ca.pem (Certificate authority that signed) file path.</p> <p>Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.</p>
18	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
19	Key Path (.pem)	Select valid Key.pem (Client key) file path.
20	Test Connection	<p>Verifies if the connection is established or not.</p> <p>Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Container ID/Name	<p>Select one or more container IDs or name to be deleted.</p> <p>Note: Format to provide multiple containers: Name1,Name2,Name3 or Name1;ID1,Name2</p> <p>The field data type is String. This field is mandatory.</p>
2	Remove Container Forcefully	<p>Specify Yes or No. If you specify Yes, the container is forcefully removed. The default value is No.</p> <p>Note: If the container is running, stop it before removing it.</p>
3	Remove Anonymous Volumes	<p>Specify Yes or No. If you specify Yes, the container and any volumes associated with it is removed. The default value is No.</p> <p>Note: If a volume was specified with a name, it will not be removed.</p>
4	Max Wait For Response (Sec)	<p>Select the amount of time to wait for a response. The default value is 10 sec.</p>

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	<p>On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	<p>On click of this button, it will cancel the window and does not save any values.</p>

11.4 Docker: Delete Image

11.4.1 Description

Docker: Delete Image step is used to delete one or more images.

Notes:

- The step removes and un-tags one or more images from the host node. If an image has multiple tags, using this command with the tag as a parameter only removes the tag. If the tag is the only one for the image, both the image and the tag are removed.
- The step does not remove the image from the registry.

11.4.2 References

<https://docs.docker.com/engine/reference/commandline/rmi/>

11.4.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker Daemon is running. The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
8	Use Key	Select if you want to use the key. Allowed values are Yes or No.
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify a valid passphrase.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.

14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
16	Docker Host URI	Select a valid Docker Host URI on which Docker Daemon is running. Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.
17	CA path (.pem)	Select a valid ca.pem (Certificate authority that signed) file path. Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.
18	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
19	Key Path (.pem)	Select valid Key.pem (Client key) file path.
20	Test Connection	Verifies if the connection is established or not. Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Image ID/Name	Select one or more Image IDs or Names to delete the image. Note: If the image is pulled with the image tag then the best practice is to provide an image name with a tag like <ImageName>:<ImageTag>. Example => Java:8 Format to provide multiple image IDs/Names => Name1,Name2,id1 or name1;name2;id1 The field data type is String. This field is mandatory.
2	Remove Image Forcefully	Select Yes or No from the dropdown. Select Yes to remove an image forcefully even if it is being used by stopped containers or has other tags. Default value is No.

3	Remove Untagged Parent Images	Select Yes or No from the dropdown. Select Yes to remove an image, along with any untagged parent images that were referenced by that image. Default value: No.
4	Max Wait For Response (Sec)	Select the amount of time to wait for a response. The default value is 10 sec.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

11.5 Docker: Inspect Container

11.5.1 Description

Docker: Inspect Container step is used to inspect one or more container.

11.5.2 References

https://docs.docker.com/engine/reference/commandline/container_inspect/

11.5.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS. Configuration type: SSH
3	Server Name	Specify the Server Name or IP Address of the server where the Docker Daemon is running. The field data type is String. This field is mandatory.

4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
8	Use Key	Select if you want to use the key. Allowed values are Yes or No.
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify a valid passphrase.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.
14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
16	Docker Host URI	Select a valid Docker Host URI on which Docker Daemon is running. Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.
17	CA path (.pem)	Select a valid ca.pem (Certificate authority that signed) file path. Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory --- and set the DOCKER_TLS_VERIFY variables as well
18	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.

19	Key Path (.pem)	Select valid Key.pem (Client key) file path.
20	Test Connection	Verifies if the connection is established or not. Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Container ID/Name	Select one or more Container IDs or Name to inspect container. Note: Use the following format to provide multiple containers: Name1,Name2,Name3 or Name1;ID1;Name2 The field data type is String. This field is mandatory.
2	Include Size Of Container	Specify Yes or No. If you specify Yes, it returns the size of the container as fields SizeRw and SizeRootFs. Default value: No.
3	Max Wait For Response (Sec)	Select the amount of time to wait for a response. The default value is 10 sec.

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Output JSON	Output field to hold the output JSON on successful plugin execution. Default is OutputJSON.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.

2	Cancel	On click of this button, it will cancel the window and does not save any values.
---	--------	--

11.6 Docker: List Containers

11.6.1 Description

Docker: List Containers step is used to get list of containers.

11.6.2 References

<https://docs.docker.com/engine/reference/commandline/ps/>

11.6.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker daemon is running. The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox

		above is disabled Password field appears as a drop down to select fields from previous steps.
8	Use Key	Specify if you want to log in using a private key. Allowed values are Yes or No. Default value: No
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify the pass-phrase used when the key-pair was generated.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.
14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
17	Docker Host URI	Select a valid Docker Host URI on which Docker Daemon is running. Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.
18	CA path (.pem)	Select a valid ca.pem (Certificate authority that signed) file path. Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.
19	Browse	Click to select the ca.pem file path.
20	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
21	Browse	Click to select the cert.pem file path.
22	Key Path (.pem)	Select valid Key.pem (Client key) file path.
23	Browse	Click to select the key.pem file path.
24	Test Connection	Verifies if the connection is established or not. Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .

Input Tab:

No.	Field Name	Description
-----	------------	-------------

Input Fields:		
1	Include All Containers	Select Yes or No. If you select 'No' then it will return only running containers, otherwise, it will return all the containers. Default value: Yes
2	Output Format	The formatting output pretty-prints container output using a Go template. Valid placeholders for the Go template are listed in Note .
3	Show Last N Created Containers	Select the value to show last n (Number) created containers. Default value is -1.
4	Include Size Of Containers	Select Yes or No. Returns the size and virtual size used by the container.
5	Filters – Get Input Fields	Specify the filters to process on the container list.
6	Max Wait For Response (Sec)	Specify the amount of time to wait for a response. The default value is 10 sec.

Output Tab:	
Field Name	Description
Output Fields:	
Container List	Holds the Containers List on successful plugin execution. Default value: Container List

NOTE:

- The filtering format is a key=value pair. If there is more than one filter, then pass multiple values in comma (,) or semicolon (;) separated values. Example.
Key=value,key=value;key=value. Available filters are as follows:

Filter	Description
<i>id</i>	Container's ID
<i>name</i>	Container's name
<i>label</i>	An arbitrary string representing either a key or a key-value pair. Expressed as <key> or <key>=<value>
<i>exited</i>	An integer representing the container's exit code. Only useful with Include All Containers equal to yes. Example. exited=0
<i>status</i>	One of created, restarting, running, removing, paused, exited, or dead Example: status=created
<i>ancestor</i>	Filters containers which share a given image as an ancestor. Expressed as <image-name>[:<tag>], <image id>, or <image@digest>
<i>before or since</i>	Filters containers created before or after a given container ID or name

<i>volume</i>	Filters running containers that have mounted a given volume or bind mount.
<i>network</i>	Filters running containers connected to a given network.
<i>publish or expose</i>	Filters containers which publish or expose a given port. Expressed as <port>[/<proto>] or <startport-endport>[/<proto>]
<i>health</i>	Filters containers based on their health check status. One of starting, healthy, unhealthy or none.
<i>isolation</i>	Windows daemon only. One of default, process, or hyperv.
<i>is-task</i>	Filters containers that are a “task” for a service. Boolean option (true or false)

2. Output Format Examples. `{{.ID}}` or `{{.ID}}: {{.Command}}` or table `{{.ID}}\t{{.Labels}}`
 Following are available Go-Templates:

Placeholder	Description
.ID	Container ID
.Image	Image ID
.Command	Quoted command
.CreatedAt	The time when the container was created.
.RunningFor	Elapsed time since the container was started.
.Ports	Exposed ports.
.State	Container status (for example; “created”, “running”, “exited”).
.Status	Container status with details about duration and health status.
.Size	Container disk size.
.Names	Container names.
.Labels	All labels are assigned to the container.
.Label	Value of a specific label for this container. For example <code>'{{.Label "com.docker.swarm.cpu"}}'</code>
.Mounts	Names of the volumes mounted in this container.
.Networks	Names of the networks attached to this container.

Output Tab:

No.	Field Name	Description
	Output Fields:	
1	Container List	Specify the output field to hold the containers list. Default value is ContainerList.

Common Buttons:

No.	Field Name	Description
	Buttons:	

1	OK	<p>On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	On click of this button, it will cancel the window and does not save any values.

11.7 Docker: Start Container

11.7.1 Description

Docker: Start Container step is used to start one or more container.

Note: If the Container is already started or running then this step will not throw an error.

11.7.2 References

<https://docs.docker.com/engine/reference/commandline/start/>

11.7.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker Daemon is running.
		The field data type is String. This field is mandatory.
4	Port	Specify a valid port.
		The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running.
		The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.

7	Password	<p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
8	Use Key	<p>Specify if you want to log in using a private key. Allowed values are Yes or No. Default value: No</p>
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify the pass-phrase used when the key-pair was generated.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.
14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
16	Docker Host URI	<p>Select a valid Docker Host URI on which Docker Daemon is running.</p> <p>Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.</p>
17	CA path (.pem)	<p>Select a valid ca.pem (Certificate authority that signed) file path.</p> <p>Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.</p>
18	Browse	Click to select the ca.pem file path.
19	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
20	Browse	Click to select the cert.pem file path.
21	Key Path (.pem)	Select valid Key.pem (Client key) file path.
22	Browse	Click to select the key.pem file path.
23	Test Connection	Verifies if the connection is established or not.

		Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .
--	--	--

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Container ID/Name	Select one or more Container IDs or Name to start container. The field data type is String. This field is mandatory.
2	Detach keys	Select the value to override the key sequence for detaching a container. Note: Format is a single character [a-Z] or ctrl-<value> where <value> is one of: a-z, @, ^, [, , or _.
3	Max Wait For Response (Sec)	Specify the amount of time to wait for a response. The default value is 10 sec.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

11.8 Docker: List Images

11.8.1 Description

Docker: List Images step is used to get list of images.

11.8.2 References

<https://docs.docker.com/engine/reference/commandline/images/>

11.8.3 Configurations

Configuration:

No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker daemon is running. The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
8	Use Key	Select if you want to use the key. Allowed values are Yes or No.
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify a valid passphrase.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.
14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	

16	Docker Host URI	Select a valid Docker Host URI on which Docker Daemon is running. Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.
17	CA path (.pem)	Select a valid ca.pem (Certificate authority that signed) file path. Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.
18	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
19	Key Path (.pem)	Select valid Key.pem (Client key) file path.
20	Test Connection	Verifies if the connection is established or not. Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Include All Images	Select Yes or No. Select Yes to show all images. Only images from a final layer (no children) are shown by default. Default is Yes.
2	Output Format	Select the formatting output pretty-prints container output using a Go template. Valid placeholders for the Go template are listed in Note .
3	Digests	Select Yes or No. Select Yes to show the digests. Default value is No.
4	Truncate Output	Select Yes or No. Select Yes to truncate the output. Default value is Yes.
5	Filters	Specify the filters to process on the image list.
6	Max Wait For Response (Sec)	Specify the amount of time to wait for a response. The default value is 10 sec.

NOTE:

- The filtering format is a key=value pair. If there is more than one filter, then pass multiple values in comma(,) or semicolon(;) separated values. Example.

Key=value,key=value;key=value. Currently, supported filters are as follows:

Filter	Description
<i>dangling</i>	Dangling=true or false
<i>label</i>	An arbitrary string representing either a key or a key-value pair. Expressed as label=<key> or label=<key>=<value> or label=<key>=<value> Note: If value contains space the use this format label=<key>=<value>.
<i>before or since</i>	(<image-name>:<tag>, <image id> or <image@digest>) - filter images created before or since given id or references. Example. Before=java:8
<i>reference</i>	reference (pattern of an image reference) - filter images whose reference matches the specified pattern. Example. reference=hello*:lat*

- Output Format Examples. {{.ID}} or {{.ID}}: {{.Repository}} or table {{.ID}}\t{{.Repository}}\t{{.Tag}}.

Following are available Go-Templates:

Placeholder	Description
.ID	Image ID
.Repository	Image repository
.Tag	Image tag
.Digest	Image digest
.CreatedSince	Elapsed time since the image was created
.CreatedAt	The time when the image was created
.Size	Image disk size

Output Tab:

No.	Field Name	Description
	Output Fields:	
1	Container List	Specify the output field to hold the containers list. Default value is ContainerList.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

11.9 Docker: Stop Container

11.9.1 Description

Docker: Stop Container step is used to stop one or more container.

Note: If the Container is already stopped then this step will not throw an error.

11.9.2 References

<https://docs.docker.com/engine/reference/commandline/stop/>

11.9.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker Daemon is running. The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.

6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	<p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p>
8	Use Key	Specify if you want to log in using a private key. Allowed values are Yes or No. Default value: No
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify the pass-phrase used when the key-pair was generated.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.
14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.
	Configuration type: SSL-TLS	
16	Docker Host URI	<p>Select a valid Docker Host URI on which Docker Daemon is running.</p> <p>Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.</p>
17	CA path (.pem)	<p>Select a valid ca.pem (Certificate authority that signed) file path.</p> <p>Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.</p>
18	Browse	Click to select the ca.pem file path.
19	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
20	Browse	Click to select the cert.pem file path.
21	Key Path (.pem)	Select valid Key.pem (Client key) file path.
22	Browse	Click to select the key.pem file path.

23	Test Connection	Verifies if the connection is established or not. Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .
----	-----------------	---

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Container ID/Name	Select one or more Container IDs or Name to stop the container. The field data type is String. This field is mandatory.
2	Wait Before Force Stop Action (In Seconds)	The number of seconds to wait before force stop action. Default is 10 seconds
3	Max Wait For Response (Sec)	Specify the amount of time to wait for a response. The default value is 10 sec.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

11.10 Docker: Update Container

11.10.1 Description

Docker: Update Container step is used to update one or more container.

Warning: This step is not supported for Windows containers.

11.10.2 References

<https://docs.docker.com/engine/reference/commandline/update/>

11.10.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Configuration Type	Select the configuration type, that is, SSH or SSL-TLS.
	Configuration type: SSH	
3	Server Name	Specify the Server Name or IP Address of the server where the Docker Daemon is running. The field data type is String. This field is mandatory.
4	Port	Specify a valid port. The field data type is String. This field is mandatory.
5	Username	Specify the valid Username to connect to server or where the Docker Daemon running. The field data type is String. This field is mandatory.
6	Accept value as variable/static	Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.
7	Password	Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). The Data Type is String. This field is mandatory. If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.
8	Use Key	Select if you want to use the key. Allowed values are Yes or No.
9	Private Key	Specify a valid private key path.
10	Browse	Click to extract the private key path.
11	Passphrase	Specify a valid passphrase.
12	Proxy Host	Specify the proxy host or IP address of the proxy host.
13	Proxy Port	Specify a valid proxy user name.
14	Proxy Username	Specify a valid proxy password.
15	Proxy Password	Specify a valid proxy password.

Configuration type: SSL-TLS		
16	Docker Host URI	Select a valid Docker Host URI on which Docker Daemon is running. Note: If you set the DOCKER_HOST then no need to provide the Docker host URI.
17	CA path (.pem)	Select a valid ca.pem (Certificate authority that signed) file path. Note: If you want to secure your Docker client connections by default, you can move the files to the .docker directory in your home directory, and also set the DOCKER_TLS_VERIFY variables.
18	Cert Path (.pem)	Select valid cert.pem (Client certificate) file path.
19	Key Path (.pem)	Select valid Key.pem (Client key) file path.
20	Test Connection	Verifies if the connection is established or not. Note: Test connection verifies if the connection is established or not. Even if the SSL-TLS connection parameters are not provided, the verification of the connection is done based on the settings provided in the connection documentation .

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Container ID/Name	Select one or more Container IDs or Name of the container to update. The field data type is String. This field is mandatory.
2	Options/Flags	Provide valid options or flags to create a container. Click the following link to get the list of flags: https://docs.docker.com/engine/reference/commandline/update/#options The field data type is String. This field is mandatory.
	Variable Field Name	Provide supported 'Options/Flags' value. For a list of 'Options/Flags' refer Note . The field data type is String. This field is mandatory.
	Static Field Name	Select Options/Flags value from the list provided in the dialog. The field data type is String. This field is mandatory.
	Field Value	Provide valid field value. The field data type is String. This field is mandatory.

3	Max Wait For Response (Sec)	Specify the amount of time to wait for a response. The default value is 10 sec.
---	-----------------------------	---

Note:

Supported Options/flags list

Name	Description
--blkio-weight	Block IO (relative weight), between 10 and 1000, or 0 to disable (default 0)
--cpu-period	Limit CPU CFS (Completely Fair Scheduler) period
--cpu-quota	Limit CPU CFS (Completely Fair Scheduler) quota
--cpu-rt-period	Limit the CPU real-time period in microseconds
--cpu-rt-runtime	Limit the CPU real-time runtime in microseconds
--cpu-shares	CPU shares (relative weight)
--cpus	Number of CPUs
--cpuset-cpus	CPUs in which to allow execution (0-3, 0,1)
--cpuset-mems	MEMs in which to allow execution (0-3, 0,1)
--kernel-memory	Kernel memory limit
--memory	Memory limit
--memory-reservation	Memory soft limit
--memory-swap	Swap limit equal to memory plus swap: '-1' to enable unlimited swap
--pids-limit	Tune container pids limit (set -1 for unlimited)
--restart	Restart policy to apply when a container exits

Common Buttons:

No.	Field Name	Description
	Buttons:	

1	OK	<p>On Click of this button the field values are checked. If any required field values are missing, then it displays a validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12 DocuSign

Use the DocuSign plugin steps for performing various actions on documents and envelope in DocuSign.

Note: For generating DocuSign refresh token, see [Appendix: DocuSign: Generate Refresh Token](#).

Prerequisites

- DocuSign Account
- Login details [Secret Key and Refresh Token] to authenticate to DocuSign.
- Generate Secret Key user's must-have DS Admin permission.
- Provide access (whitelist) to the following URL through your firewall and network.
<https://account-d.docusign.com>

References

- <https://developers.docusign.com/platform/auth/authcode/authcode-get-token/>
- Use this reference when adding a recipient to an envelope,
<https://developers.docusign.com/docs/esign-rest-api/reference/envelopes/enveloperecipients/>

Notes:

- Supported file types: .doc, .docm, .docx, .dot, .dotm, .dotx, .htm, .html, .msg, .pdf, .rtf, .txt, .wpd, .xps, .bmp, .gif, .jpg, .jpeg, .png, .tif, .tiff, .pot, .potx, .pps, .ppt, .pptm, .pptx, .csv, .xls, .xlsm, .xlsx.
- DocuSign recommends that you do not add files larger than 25MB to an envelope. Depending on the recipient's internet connection, large files might affect signing performance.
- DocuSign has not imposed a limit on the number of files that can be added to an envelope. However, as with file size, envelopes with a large number of files might affect signing performance.

- For signer-uploaded attachment files, DocuSign supports files sizes up to 25MB for an envelope.
- There is a file size limit of 5MB for attaching completed documents to emails sent by DocuSign to recipients when an envelope is completed. If the completed documents are greater than 5MB, the email still provides a link to the documents on the DocuSign system.
- There is a limit to a call rate of 1,000 API calls per hour per account. If the API call rate limit is reached, you will receive an exception for each call until the start of the next hour (this can be up to 60 minutes). The exception message states: “The maximum number of hourly API invocations has been exceeded” (error number 207).
- If you have opened **Sender View** of the template, you are updating through this step in DocuSign, then that template will be locked. You will see an error message, ‘*The user is not the owner of the lock. The template is locked by another user or in another application.*’ To resolve the issue, you must **Save** and **Close** the template from DocuSign.

12.1 DocuSign: Add Document In Envelope

12.1.1 Description

DocuSign: Add Document In Envelope step adds a document in an Envelope in DocuSign.

12.1.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform.

		The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Envelope ID	Specify the ID of the envelope in which you want to add a document The field data type is String. This field is mandatory.
2	Document To Upload	Specify the document you want to add to the envelope. The field data type is String. This field is mandatory. For more information about documents that you can upload, see Notes .
3	Browse	Click to select the file to upload.
4	Document Name After Upload	Specify the name of the document with extension.

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Document ID	It is the ID of the added document will be given as output using this field. Default is DocumentID.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12.2 DocuSign: Add Document In Template

12.2.1 Description

DocuSign: Add Document In Template step adds a document in a template.

12.2.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
3	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
4	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
5	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Template ID	Specify the ID of the template in which you want to add a document The field data type is String. This field is mandatory.
2	Document To Upload	Specify the document you want to add to the template. The field data type is String. This field is mandatory.
3	Browse	Click the button to select the file path and then select the document to upload.
4	Document Name After Upload	Specify a valid name along with the extension. The extension must be same as the extension of the document in the Document To Upload field. This field is used to rename the document.

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Document ID	Specify the ID of the added document in this field. The default value is <i>DocumentID</i> .

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

Notes:

This document is for your company's internal use only and may not be distributed to any third party.

If you have opened **Sender View** of the template, you are updating through this step in DocuSign, then that template will be locked. You will see an error message, ‘*The user is not the owner of the lock. The template is locked by another user or in another application.*’ To resolve the issue, you must **Save** and **Close** the template from DocuSign.

12.3 DocuSign: Add Field In Document

12.3.1 Description

DocuSign: Add Field In Document step adds a Field in the document present in the envelope in DocuSign.

12.3.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test

		Connection button will only work with static (hardcoded) values and environment variables.
--	--	--

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Envelope ID	Specify the ID of the envelope in which you want to add a document The field data type is String. This field is mandatory.
2	Field Type	Specify the type of field you want to add using this step. The field data type is String. This field is mandatory.
4	Get	Click to populate the recipient types.
3	Recipient ID	Specify the ID of the recipient that is associated with the tab. The field data type is String. This field is mandatory.
4	Get	Click to populate the recipient IDs.
5	Document ID	Specify the document ID number that the Field is placed on. The field data type is String. This field is mandatory.
6	Get	Click to populate the document IDs.
7	Page Number	Specify the Page Number in a document in which sign field is to be added. The field data type is String. This field is mandatory.
8	X Position	Specify the position with respect to the x-axis (in pixel) where the field will be added. The field data type is String. This field is mandatory.
9	Y Position	Specify the position with respect to the y-axis (in pixel) where the field will be added. The field data type is String. This field is mandatory.

Common Buttons:		
No.	Field Name	Description
	Buttons:	

1	OK	<p>On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	<p>On click of this button, it will cancel the window and does not save any values.</p>

12.4 DocuSign: Add Recipient In Envelope

12.4.1 Description

DocuSign: Add Recipient In Envelope step adds a Recipient in Envelope in DocuSign.

12.4.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	<p>Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform.</p> <p>The field data type is String. This field is mandatory.</p>
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	<p>Select or specify a valid refresh token.</p> <p>The field data type is String. This field is mandatory.</p>
6	Test Connection	<p>Verifies whether the connection is established or not.</p> <p>Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Envelope ID	Specify the ID of envelope in which you want to add recipient. The field data type is String. This field is mandatory.
2	Recipient Type	Specify the type of recipient you want to add using this step. The field data type is String. This field is mandatory.
3	Get	Click to populate the list of recipient types.
4	Routing Order	Specify the routing order of the recipient in the envelope. It specifies order in which email will be sent among all recipients present in envelope. The field data type is String. This field is mandatory.
5	Name	Specify the full legal name of the recipient. The field data type is String. This field is mandatory.
6	Email	Specify the email address of the envelope recipients. The field data type is String. This field is mandatory.
7	Email Subject	Specify the subject of the email used to send the envelope. Maximum Length: 100 characters. The field data type is String. This field is mandatory.
8	Email Body	Specify a string with the email message sent to the recipient. Maximum Length: 10000 characters. The field data type is String. This field is mandatory. Note: Use ‘ \n ’ to change line.
9	Email language	Select the two-letter code for the language to use for the standard email format and the signing view for the recipient. For example, for English US code is <i>en</i> .
10	Get	Click to populate the list of languages available in DocuSign.

Output Tab:		
No.	Field Name	Description
	Input Fields:	
1	Recipient ID	Specify the ID of the added recipient that will be given as output using this field.

		The field data type is String. This field is mandatory.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12.5 DocuSign: Add Recipient In Template

12.5.1 Description

DocuSign: Add Recipient In Template step adds a recipient in template in DocuSign.

12.5.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.

6	Test Connection	<p>Verifies whether the connection is established or not.</p> <p>Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.</p>
---	-----------------	--

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Template ID	<p>Specify the ID of the template in which you want to add recipient.</p> <p>The field data type is String. This field is mandatory.</p>
2	Recipient Type	<p>Specify the type of recipient you want to add using this step. Each recipient is assigned a specific recipient type, which defines their role in the signing process.</p> <p>The field data type is String. This field is mandatory.</p>
3	Get	<p>Click to populate the list of recipient types.</p>
4	Routing Order	<p>Specify the routing order of the recipient in the envelope. It specifies order in which email will be sent among all recipients present in envelope.</p> <p>The field data type is String. This field is mandatory.</p>
5	Email Subject	<p>Specify the subject of the email used to send the envelope. Maximum Length: 100 characters.</p> <p>The field data type is String. This field is mandatory.</p>
6	Role Name	<p>Specify the role name associated with the recipient. It must either be a <i>Name</i> and <i>Email</i> OR <i>Role Name</i>.</p> <p>The field data type is String. This field is mandatory.</p>
7	Name	<p>Specify the full legal name of the recipient. It must either be a <i>Name</i> and <i>Email</i> OR <i>Role Name</i>.</p> <p>The field data type is String. This field is mandatory.</p>
8	Email	<p>Specify the email address of the envelope recipients. It must either be a <i>Name</i> and <i>Email</i> OR <i>Role Name</i>.</p> <p>The field data type is String. This field is mandatory.</p>

9	Email Body	Specify a string with the email message sent to the recipient. Maximum Length: 10000 characters. The field data type is String. This field is mandatory. Note: Use ‘ \n ’ to change line.
10	Email language	Specify or select the two-letter code for the language to use for the standard email format and the signing view for the recipient. For example, for English US code is <i>en</i> .
11	Get	Click to populate the list of languages available in DocuSign.

Output Tab:

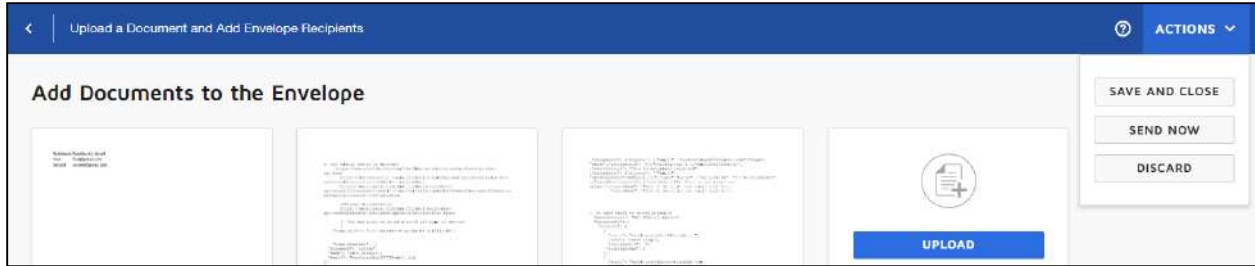

No.	Field Name	Description
	Output Fields:	
1	Recipient ID	Specify the ID of the added recipient that will be given as output using this field. The default value is <i>RecipientID</i> . The field data type is String. This field is mandatory.

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

Note:

If you have opened **Sender View** of the template, you are updating through this step in DocuSign, then that template will be locked. You will see an error message, ‘*The user is not the owner of the lock. The template is locked by another user or in another application.*’ To resolve the issue, you must **Save** and **Close** the template from DocuSign.

12.6 DocuSign: Create Draft Envelope

12.6.1 Description

DocuSign: Create Draft Envelope step creates an empty envelope in a draft in DocuSign.

12.6.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Output Tab:		
No.	Field Name	Description
	Input Fields:	
1	Envelope ID	Specify the generated ID of created envelope that is given as output through this field. The field data type is String. This field is mandatory.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12.7 DocuSign: Create Draft Envelope Using Template

12.7.1 Description

DocuSign: Create Draft Envelope Using Template step creates a draft envelope using the template ID in DocuSign.

12.7.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Specify or select a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.

4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Specify or select a valid refresh token. The field data type is String. This field is mandatory.
7	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:	
Field Name	Description
Input Fields:	
Template ID	Specify the ID of the template from which you want to create an envelope. The field data type is String. This field is mandatory.

Output Tab:		
No.	Field Name	Description
Output Fields:		
1	Envelope ID	Specify the generated ID of created envelope that is given as output through this field. The default value is <i>EnvelopeID</i> .

Common Buttons:		
No.	Field Name	Description
Buttons:		
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12.8 DocuSign: Create Template

12.8.1 Description

DocuSign: Create Template step creates an empty template in DocuSign.

12.8.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Template Name	Specify the name of the Template. The length of the name should be less than 100 characters. The field data type is String. This field is mandatory.

2	Template Description	Specify the description of the template. The length of the character should be less than 500 characters.
---	----------------------	--

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Template ID	Specify the generated ID of created Template is given as output through this field. The default value is TemplateID.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12.9 DocuSign: Delete Documents From Envelope

12.9.1 Description

DocuSign: Delete Documents From Envelope step will delete single as well as multiple documents from the existing envelope that has not yet been completed in DocuSign.

12.9.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.

3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Envelope ID	Select the ID of the envelope from which you want to delete the document. The field data type is String. This field is mandatory.
2	Document ID(s)	Select the unique ID of Document. To delete multiple documents, separate by ",". For example, 792015,792016,792017. The field data type is String. This field is mandatory.
	Button: Get	Click to get the document ID.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message.

		If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12.10 DocuSign: Delete Recipient From Envelope

12.10.1 Description

DocuSign: Delete Recipient From Envelope step will delete a recipient from a draft or sent envelope in DocuSign. If the envelope is "In Process" (has been sent and is not completed or voided), recipients that have completed their actions cannot be deleted.

12.10.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Envelope ID	Select the ID of the envelope from which you want to get recipients. The field data type is String. This field is mandatory.
2	Recipient ID(s)	Specify the unique ID of recipient. The field data type is String. This field is mandatory.
	Button: Get	Click to get the document ID.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

12.11 DocuSign: Download Documents From Envelope

12.11.1 Description

DocuSign: Download Documents From Envelope step will download documents from an envelope in DocuSign.

12.11.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.

3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Envelope ID	Select the ID of the envelope from which you want to download documents. The field data type is String. This field is mandatory.
2	Local Folder Path	Select the local folder path to download the document at. The field data type is String. This field is mandatory.
	Button: Browse	Click to select the file path to download the documents.
3	Document ID	Select the unique ID of the document. If you want to download any specific document, then give the ID of that document. Note: If this field is left empty then all the documents from the envelope will be downloaded.
	Button: Get	Click to get the list of document IDs.

Additional Input Tab:		
No.	Field Name	Description
	Additional Input Fields:	

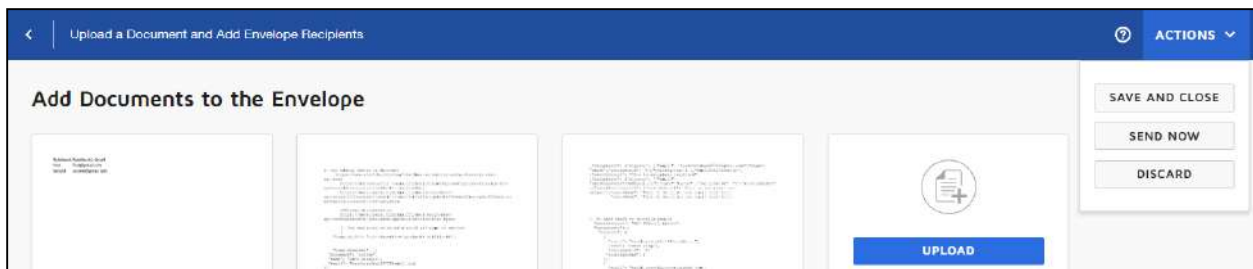

1	Delete Output Folder Contents before Downloading	Select <i>Yes</i> or <i>No</i> . Select <i>Yes</i> to deletes all files and folders from the specified local folders before downloading. The default value is <i>No</i> .
2	Add DateTimeStamp for Duplicate Files	Select <i>Yes</i> or <i>No</i> . If the local folder contains the same file name, then add a date timestamp in the newly-downloaded file. If the value is false, then the file will be overwritten. The default value is <i>No</i> .
3	Add File To Result	Select <i>Yes</i> or <i>No</i> . Select <i>Yes</i> to add downloaded file as the result of workflow. The allowed value is <i>Yes</i> or <i>No</i> . The default value is <i>No</i> .

Common Buttons:

No.	Field Name	Description
	Buttons:	
1	OK	On click of this button the field values are checked. If any required field values are missing, then it displays a validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and does not save any values.

Note:

If you have opened **Sender View** of the template, you are updating through this step in DocuSign, then that template will be locked. You will see an error message, *'The user is not the owner of the lock. The template is locked by another user or in another application.'* To resolve the issue, you must **Save** and **Close** the template from DocuSign.

12.12 DocuSign: Get Documents From Envelope

12.12.1 Description

DocuSign: Get Documents From Envelope step fetches document details from the envelope in DocuSign.

12.12.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Accept value as variable/static	Leave checkbox unchecked to accept secret key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.
3	Secret Key	Select or specify a valid secret key. A secret key is a value that is stored securely in your web server and only shared with your web server and the DocuSign platform. The field data type is String. This field is mandatory.
4	Accept value as variable/static	Leave checkbox unchecked to accept refresh token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as text box.
5	Refresh Token	Select or specify a valid refresh token. The field data type is String. This field is mandatory.
6	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:

13.1 Dropbox: Copy File Or Folder

13.1.1 Description

Dropbox: Copy File or Folder plugin step copies a file or folder on Dropbox.

13.1.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	App Key*	Select the application key of the Dropbox application. The field data type is String. This is a mandatory field.
3	Accept Value as variable/static	Leave checkbox unchecked to accept App Secret from a field in the previous steps of the stream using a drop down list. Else enable checkbox for App Secret field to appear as Text box.
4	App Secret	Specify the App Secret of Dropbox application. App Secret is entered using a widget. If the Accept Values as variable/static check box is selected, then the App Secret field appears as text box and accepts static values or variables. Else, select App Secret from the drop down list. The field data type is String. This is a mandatory field.
5	Accept Value as variable/static	Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as Text box.
6	Refresh Token	Provide the Refresh Token generated by using connection documentation. If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list. The field data type is String. This is a mandatory field.
7	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Source File Or Folder Path	Specify the Dropbox source path of file or folder to copy. The data type is String This field is mandatory.
2	Destination Path File Or Folder	Specify the Dropbox destination path of file or folder to be copied. The data type is String This field is mandatory. Note: <ul style="list-style-type: none"> Provide Dropbox Folder reference as: /<ExistingFolder>/<FolderName>. If the provided path contains a folder that does not exist on Dropbox, then a new folder with the specified name is created in the path. For example, /Sample Folder/NewFolderName/Test.exe, here NewFolderName is created in the Sample Folder.
3	Auto Rename	Auto Rename field is used to auto rename any file or folder to avoid conflict if already exists in the Dropbox destination path. Allowed values are: Yes, No. Default Value: Yes
4	Allow Ownership Transfer	Provide the ownership when the operation is performed. Allowed values are: Yes, No. Default Value: No

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Output File Or Folder Path	Specify the output field name. Default value: <i>OutputFileOrFolderPath</i>

13.2 Dropbox: Create Folder

13.2.1 Description

Dropbox: Create Folder plugin step creates a folder on Dropbox.

13.2.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	App Key*	Select the application key of the Dropbox application. The field data type is String. This is a mandatory field.
3	Accept Value as variable/static	Leave checkbox unchecked to accept App Secret from a field in the previous steps of the stream using a drop down list. Else enable checkbox for App Secret field to appear as Text box.
4	App Secret	Specify the App Secret of Dropbox application. App Secret is entered using a widget. If the Accept Values as variable/static check box is selected, then the App Secret field appears as text box and accepts static values or variables. Else, select App Secret from the drop down list. The field data type is String. This is a mandatory field.
5	Accept Value as variable/static	Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as Text box.
6	Refresh Token	Provide the Refresh Token generated by using connection documentation. If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list. The field data type is String. This is a mandatory field.
7	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

No.	Field Name	Description
	Input Fields:	
1	Dropbox Folder Path	<p>Specify the folder path on which the folder is to be created.</p> <p>Note:</p> <ul style="list-style-type: none"> • Provide Dropbox File Path reference as: /<FolderName>/<FileName.extension> • Provide Dropbox Folder reference as: /<FolderName> • If the provided path contains a folder that does not exist on Dropbox, then a new folder with the specified name is created in the path. For example, /Sample Folder/NewFolderName/Test.exe, here NewFolderName is created in the Sample Folder. For example: /<ExistingFolderPath>/<NewFolderName> <p>The data type is String This field is mandatory.</p>
2	Auto Rename	<p>Auto Rename field is used to auto rename any folder to avoid conflict if already exists in the Dropbox Folder Path.</p> <p>Default Value: No</p>

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Created Folder Path	<p>Specify the output field name.</p> <p>Default value: <i>CreateFolderPath</i></p>

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	<p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	<p>On click of this button, it will cancel the window and do not save any values</p>

13.3 Dropbox: Delete File Or Folder

13.3.1 Description

Dropbox: Delete File Or Folder step deletes file or folder on Dropbox.

Note:

1. To provide required permissions on App registration portal click on Permissions Tab.
2. Root folder is not supported for deleting.

13.3.2 Configurations

General Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	App Key	Specify the application key of the Dropbox application. The data type is secure string. This field is mandatory.
3	App Secret	Specify the App Secret. The data type is string. This field is mandatory.
4	Refresh Token	Provide the Refresh Token generated by using connection documentation .

Input Tab		
No.	Field Name	Description
	Input Fields:	
1	File Or Folder Path	Specify the file or folder path to delete. The data type is string. This field is mandatory. Note: <ol style="list-style-type: none"> 3. To give Dropbox File Path reference “/<FolderPath>/<FileName. Extension>”. 4. To give Dropbox Folder Path reference “/<FolderPath>/<FolderName>”.

Common Buttons:		
No.	Field Name	Description
	Buttons:	

1	OK	<p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p>
2	Cancel	On click of this button, it will cancel the window and do not save any values.

13.4 Dropbox: Download File Or Folder

13.4.1 Description

Dropbox: Download File Or Folder step downloads file on Dropbox.

Note:

- There are few files which do not support the Download functionality. Such files may support the Export functionality. For more information, see [Dropbox API](#) documentation.
- Root folder is not supported for deleting.
- Download a folder from the user's Dropbox, as a zip file. The folder must be less than 20 GB in size and any single file within must be less than 4 GB in size. The resulting zip must have fewer than 10,000 total file and folder entries, including the top level folder. The input cannot be a single file.

13.4.2 Configurations

General Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	App Key	Specify the application key of the Dropbox application. The data type is secure string. This field is mandatory.
3	App Secret	Specify the App Secret. The data type is string. This field is mandatory.
4	Refresh Token	Provide the Refresh Token generated by using connection documentation .

Input Tab		
No.	Field Name	Description

Input Fields:		
1	Step name	Name of the step. This name has to be unique in a single workflow.
2	File Or Folder Path	Dropbox path of file or folder path to download. Note: <ul style="list-style-type: none"> To give Dropbox File Path reference “/<FolderPath>/<FileName. Extension>”. To give Dropbox Folder Path reference “/<FolderPath>/<FolderName>”.
3	Browse	To browse the folder path to download file from Dropbox.
4	Output Folder Path	Folder path to download file at given location.
5	Delete Output Folder Contents Before Downloading	Specify Yes to delete output folder contents before downloading else Specify No. Allowed values: Yes, No.
6	Add Date TimeStamp For Duplicate File	Specify Yes to add Date TimeStamp for duplicate files. Allowed values: Yes, No.
7	Add File To Result	Specify Yes to add the downloaded files to result set and display download link on AE otherwise else select No. Allowed values: Yes, No.

Output Tab		
No.	Field Name	Description
Output Field:		
1	File Or Folder Overwritten	Specify a field name that returns Yes if file or folder is overwritten else No. This field is mandatory.

Common Buttons:		
No.	Field Name	Description
Buttons:		
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.

2	Cancel	On click of this button, it will cancel the window and do not save any values

13.7 Dropbox: Share File Or Folder

13.7.1 Description

Dropbox: Share File or Folder plugin step shares a file or folder.

13.7.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	App Key*	Select the application key of the Dropbox application. The field data type is String. This is a mandatory field.

3	Accept Value as variable/static	Leave checkbox unchecked to accept App Secret from a field in the previous steps of the stream using a drop down list. Else enable checkbox for App Secret field to appear as Text box.
4	App Secret	Specify the App Secret of Dropbox application. App Secret is entered using a widget. If the Accept Values as variable/static check box is selected, then the App Secret field appears as text box and accepts static values or variables. Else, select App Secret from the drop down list. The field data type is String. This is a mandatory field.
5	Accept Value as variable/static	Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as Text box.
6	Refresh Token	Provide the Refresh Token generated by using connection documentation. If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list. The field data type is String. This is a mandatory field.
7	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	File Or Folder Path	Specify a Dropbox file path or folder to create its shared link. The data type is String This field is mandatory.

Additional Input Tab:		
No.	Field Name	Description
	Link Settings:	

1	Access Level	Specify an access level to the shared link The Allowed Values are viewer, editor, max. The default value is Viewer. The data type is String. Note: Shared files can only have edit (editor) and Max (max) privileges for Google Docs and Microsoft files.
2	Shared Link Expiry Date	Specify the date to set the expiry timestamp of the shared link (format: MM/DD/YYYY). The data type is String.
3	Who Has Access	Specify a value to manage the effective audience access that benefits from shared link. Allowed Values are: AnyoneWithLink, TeamMembers, no_one, PeopleWithPassword. The default value is AnyoneWithLink. The data type is String.
4	Shared Link Password	Specify the password for the shared link. The shared link password is works only if, Require Password is Yes and Who Has Access is set to PeopleWithPassword. The data type is String.
5	Disable Download	This field is used to control download permission using the shared link. Specify Yes to disable download else No. The allowed values are: Yes, No. The default value is No. The data type is String.
	Folder Settings:	
6	Folder Membership	Specify an option to limit who can be added as a member of the folder. The options are: Anyone, TeamMembers. The default value is: Anyone. The data type is String.
7	Manage Access	Specify who choose who can add people to the folder. The allowed values are: Owner, TeamMembers. The default value is TeamMembers. The data type is String.
8	Link Restrictions	Specify an option to prevent non-members from accessing the folder via link. Allowed values are: Anyone/Members. The default value is Anyone. The data type is String.
9	Viewer Info	Specify Yes to show who viewed files in this folder to team members and people who can edit. The allowed values are: Yes, No. The default value is Yes. The data type is String.

Output Tab:

No.	Field Name	Description
	Output Field:	
1	Shared Link URL	Specify an output field to hold the shared link URL created. This field is mandatory.

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values

13.8 Dropbox: Upload File

13.8.1 Description

Dropbox: Upload File step uploads file on Dropbox.

13.8.2 Configurations

General Tab:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	App Key	Specify the application key of the Dropbox application. The data type is secure string. This field is mandatory.
3	App Secret	Specify the App Secret. The data type is string. This field is mandatory.
4	Refresh Token	Provide the Refresh Token generated by using connection documentation .

Input Tab		
No.	Field Name	Description
	Input Fields:	
1	File To Upload	Local path of file to upload on Dropbox.
2	Browse	To browse the path of file to upload on Dropbox.
3	Dropbox File Path	Path in the user's Dropbox to save the file.

4	If File Exists on Dropbox Path	If File Exists on Dropbox Path is used to auto rename, overwrite a file on Dropbox. Default value : ThrowException Allowed Values:- AutoRename, Overwrite, ThrowException
5	Client Modified Timestamp (UTC)	Client Modified Timestamp (UTC) is additional timestamp, used to provide the file modified timestamp. By default it takes current timestamp.
6	Send Notifications To Desktop Client	The user is made aware of any file modification by sending a notification. It will send notification if not set to No. Default: Yes. Allowed Values: Yes, No

Common Buttons:		
No.	Field Name	Description
	Buttons:	
1	OK	On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. If all the required field values are provided then it will save the field values.
2	Cancel	On click of this button, it will cancel the window and do not save any values.

Notes:

- To give Dropbox File Path reference “/FolderName/FileName.extension”.
- Specify the timestamp as per the tooltip provided in Client Modified Timestamp (UTC) field.
Timestamp format: - yyyy-MM-DDTHH-mm-ssZ
- Access Token generation is one time process for any app, this token never expires unless new is generated. Please do not share the generated Access Token.
- The maximum size of a file one can upload to an upload session is 350 GB.
- If the path provided contains a folder not present on Dropbox it will create a folder with the name provided in the path viz., /Sample Folder/NewFolderName/Test.exe, here the NewFolderName will be create inside Sample Folder.
- If you want to upload file in root then provide "/" with file name, for example, "/FileName.extension".

14 Dynamic 365

Dynamics 365 plugin is designed to perform operations on Dynamic 365 entities.

Prerequisites:

- Dynamics 365 CRM instance with access details.
- User must be authorized to access the specified entity and perform the requisite operation such as query, delete, insert and update.

14.1 Dynamics 365: Delete Entity

14.1.1 Description

Dynamics 365: Delete Entity plugin step deletes one or more Dynamics 365 entity records matching the given criterion.

14.1.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the Dynamics 365 CRM Instance. For example, https://XXXXX.crm8.dynamics.com The field data type is String. This is mandatory.
3	Tenant ID	Specify Tenant ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory.

		Note: To create Tenant ID refer plugin prerequisites and references.
4	Client ID	Specify Client ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory. Note: To create Client ID refer plugin prerequisites and references.
	Client Secret:	Note: To create Client Secret refer the plugin prerequisites and references.
5	Accept Values from fields	Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.
6	Client Secret	Provide the Client Secret to authenticate Dynamics 365 CRM Instance. Client Secret is entered using a widget. If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps. The field data type is String This field is mandatory.
7	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Entity Name	Select an Entity name to delete a specific record. The field data type is String. This is mandatory.
2	Get	On click of this button, if the connection is successfully established it populates the list of Entity names on the Dynamics 365 CRM instance.
3	Criteria Field	Specify a valid criteria field name to search the record.
4	Get	On click of this button, if the connection is successfully established it populates the list of fields associated with the Entity Name on the Dynamics 365 CRM instance.
5	Criteria Value	Value of the respective field to search the record.

		Specify a query criterion that fetches a unique record or else set 'Delete Multiple Records '=Yes. An invalid query criterion throws a no records found error.
6	Delete Multiple Records	Allowed Values: 'Yes' or 'No'. If the specified value is 'Yes', multiple records matching specified criteria will be deleted. Default Value: No

Output Tab:		
No.	Field Name	Description
	Output Field:	
1	Deleted Record IDs	Specify an output field to hold the holds the IDs of deleted records. The default value is DeletedRecordIDs The field data type is String. This is mandatory.

14.2 Dynamics 365: Get Entity Records

14.2.1 Description

Dynamics 365: Get Entity Records plugin step fetches all Dynamics 365 entity records matching the query criterion.

Note: This step generates multiple rows hence, use it as the first step in the workflow.

14.2.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the Dynamics 365 CRM Instance. For example, https://XXXXX.crm8.dynamics.com The field data type is String. This is mandatory.
3	Tenant ID	Specify Tenant ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory. Note: To create Tenant ID refer plugin prerequisites.
4	Client ID	Specify Client ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory. Note: To create Client ID refer plugin prerequisites.

	Client Secret:	Note: To create Client Secret refer the plugin prerequisites.
5	Accept Values from fields	Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.
6	Client Secret	Provide the Client Secret to authenticate Dynamics 365 CRM Instance. Client Secret is entered using a widget. If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps. The field data type is String This field is mandatory.
7	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Entity Name	Select an Entity name to delete a specific record. The field data type is String. This is mandatory.
2	Get	On click of this button, if the connection is successfully established it populates the list of Entity names on the Dynamics 365 CRM instance.
3	Criteria Query	Provide a Criteria Query to fetch all Dynamics 365 CRM matching records. The field data type is String. This is mandatory. Sample Criteria Query: <ul style="list-style-type: none"> • "Account Name" eq 'RPA Test' • 'Total Amount' eq 1500.55 • "Account Number" eq "INC0010097" • "Account Name" eq 'Proseware, Inc.' and "Status" eq 0 <p>Refer to the links below to check the Criteria Query supported for the given Entity Name (Criteria Value type required for the specified Criteria Field).</p> <ul style="list-style-type: none"> • https://docs.microsoft.com/en-us/powerapps/developer/common-data-service/webapi/query-data-web-api

		<ul style="list-style-type: none"> • https://docs.microsoft.com/en-us/dynamics365/customer-engagement/web-api/entitytypes?view=dynamics-ce-odata-9 <p>Note:</p> <ul style="list-style-type: none"> • Provide display names in the criteria query. • Provide criteria field in double-quotes & criteria value in single quotes if it is a string or without quotes for other types. <p>Limitation: Lookup fields are not supported.</p>
4	Fetch Records Batch Size	<p>Input step will give the output based upon the batch size. By this provision, it will fetch the records in the provided batches. It must be a positive number.</p> <p>The field data type is String. This is mandatory.</p>

Output Tab:		
No.	Field Name	Description
	Output Fields (Tabular):	
1	Field Name	<p>On click of the cell in the output table, if the connection is successfully established it populates the list of fields associated with the Entity Name on the Dynamics 365 CRM instance.</p> <p>The field data type is String. This is mandatory.</p> <p>Note: At least one 'Field Name' and 'Output Field' must be provided.</p>
2	Output Field	<p>Specify an output field to hold valid values for the fields associated with the field name.</p> <p>The field data type is String. This is mandatory.</p>

14.3 Dynamics 365: Insert Entity

14.3.1 Description

Dynamic 365: Insert Entity plugin step inserts in a record in a Dynamics 365 entity.

Note: For lookup fields, provide the GUID of the selected target in the 'Field Value' column of 'Table Fields'. You can copy GUID from address bar with format -> id=c1852f57-6ab9-ec11-983f-000d3aca381e.

Limitations:

Following field types are not supported:

- In Table Fields, PartyList and Regarding lookup field types.
- In Table Fields, in custom lookup fields, lookup fields having different Logical names and Schema names will not work.
- File and Image field types are not supported.

14.3.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the Dynamics 365 CRM Instance. For example, https://XXXXX.crm8.dynamics.com The field data type is String. This is mandatory.
3	Tenant ID	Specify Tenant ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory. Note: To create Tenant ID refer plugin prerequisites.
4	Client ID	Specify Client ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory. Note: To create Client ID refer plugin prerequisites.
	Client Secret:	Note: To create Client Secret refer the plugin prerequisites.
5	Accept Values from fields	Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.

6	Client Secret	<p>Provide the Client Secret to authenticate Dynamics 365 CRM Instance.</p> <p>Client Secret is entered using a widget. If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.</p> <p>The field data type is String This field is mandatory.</p>
7	Test Connection	<p>Verifies whether the connection is established or not.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>

Input Tab:		
No.	Field Name	Description
Input Fields:		
1	Entity Name	<p>Select an Entity name to insert a record.</p> <p>The field data type is String. This is mandatory.</p> <p>Note:</p> <ul style="list-style-type: none"> • User must be authorized to access specified entity name. • User must have appropriate permissions on Dynamics365 CRM instance to insert a record with 'Dynamics 365: Insert Entity' step.
2	Get	<p>On click of this button, if the connection is successfully established it populates the list of Entity names on the Dynamics365 CRM instance.</p>
3	Accept Fields As JSON	<ul style="list-style-type: none"> • If Checkbox is selected, the 'JSON' field will be used to insert the record. • If the checkbox is not selected 'Table Fields' will be used to build the JSON to insert the record. In this case provide at least one of 'Variable Field Name' or 'Static Field Name' and the corresponding 'Field Value'.
4	JSON	<p>In this field provide JSON in valid format to insert the record. Select a field name from the drop-down list or provide a variable; containing the JSON text.</p> <p>The field data type is String.</p> <p>JSON sample syntax format:-</p> <pre data-bbox="641 1780 1430 1829">{"fieldName1":"fieldValue1","fieldName2":"fieldValue2", "lookupFieldName3_targetField@odata.bind":</pre>

		<pre>"/entitySetNameOfTarget(guidFieldValue3)", "lookupFieldName4@odata.bind": "/entitySetNameOfTarget(guidFieldValue4)"} Sample JSON: {"customerid_account@odata.bind":"/accounts(0faa50fe-e7d0-4e9d-bdfd-3aacc2d9cbdd)", "name":"Order8","shippingmethodcode":"4", "pricelevelid@odata.bind": "/pricelevels(10f883f4-8d0a-ea11-a811-000d3a1b1d16)"} </pre>
	Table Fields	If 'Accept Fields As JSON' is selected. Provide at least one 'Field Name' and 'Field Value'
1	Field Name	Click on the cell in the input table, to populate fields associated with the entity name. The field data type is String. This is mandatory.
2	Field Value	Specify the value of the respective field associated with the Field Name. The field data type is String. This is mandatory.
3	Targets	Click on the cell in the input table, to populate targets associated with the Field Name.

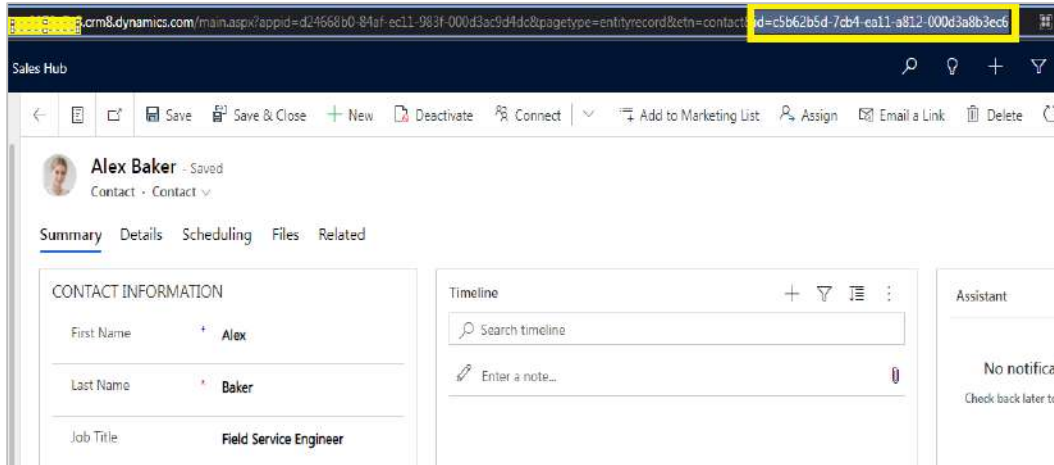

Output Tab:		
No.	Field Name	Description
	Output Fields (Tabular):	
1	Record ID	Specify an output field to hold the ID of the record created in Dynamics 365 CRM instance. Default value is RecordID. The field data type is String. This is mandatory.

14.4 Dynamics 365: Update Entity

14.4.1 Description

Dynamic365: Update Entity plugin step updates one or more Dynamics 365 entities matching the given query criterion.

Note: For lookup fields, provide the GUID of the selected target in the 'Field Value' column of 'Table Fields'. You can copy GUID from address bar with format -> id=c1852f57-6ab9-ec11-983f-000d3aca381e.

Limitations:

Following field types are not supported:

- In Table Fields, PartyList and Regarding lookup field types.
- In Table Fields, in custom lookup fields, lookup fields having different Logical names and Schema names will not work.
- File and Image field types are not supported.

14.4.2 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the Dynamics 365 CRM Instance. For example, https://XXXXX.crm8.dynamics.com The field data type is String. This is mandatory.
3	Tenant ID	Specify Tenant ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory. Note: To create Tenant ID refer plugin prerequisites.
4	Client ID	Specify Client ID to authenticate Dynamics 365 CRM Instance. The field data type is String. This is mandatory. Note: To create Client ID refer plugin prerequisites.
	Client Secret:	Note: To create Client Secret refer the plugin prerequisites.
5	Accept Values from fields	Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list.

		Else enable checkbox for Client Secret field to appear as Text box.
6	Client Secret	<p>Provide the Client Secret to authenticate Dynamics 365 CRM Instance.</p> <p>Client Secret is entered using a widget. If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.</p> <p>The field data type is String This field is mandatory.</p>
7	Test Connection	<p>Verifies whether the connection is established or not.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Entity Name	<p>Select an Entity name to update a specific record. The field data type is String. This is mandatory.</p> <p>Note:</p> <ul style="list-style-type: none"> User must have appropriate permissions in Dynamics 365 CRM instance to update a record through 'Dynamics 365: Update Entity' step. User must be authorized to access specified entity name.
2	Button: Get	On click of this button, if the connection is successfully established it populates the list of Entity names on the Dynamics 365 CRM instance.
3	Criteria Field	Provide a Criteria field name to search the record to be updated. The field data type is String. This is mandatory.
4	Button: Get	On click of this button, if the connection is successfully established it populates the list of fields associated with the Entity Name on the Dynamics 365 CRM instance.
5	Criteria Value	<p>Value of the respective field to search the record.</p> <ul style="list-style-type: none"> Specify a query criterion that fetches a unique record or else set 'Update Multiple Records'=Yes. An invalid query criterion throws a no records found error. <p>Refer to References section in the plugin header for details.</p>

6	Update Multiple Records	<p>Allowed Values: 'Yes' or 'No' If given 'Yes', multiple records matching specified criteria will be updated. Default value: No</p>
7	Accept Fields As JSON	<ul style="list-style-type: none"> • If Checkbox is selected, the 'JSON' field below will be used to update the record. • If the checkbox is not selected 'Table Fields' will be used to build the JSON to update the record. In this case provide at least one of 'Variable Field Name' or 'Static Field Name' and the corresponding 'Field Value'.
8	JSON	<p>In this field provide JSON in valid format to update the record. Select a field name from the drop-down list or provide a variable; containing the JSON text.</p> <p>JSON sample syntax format:-</p> <pre>{ "fieldName1": "fieldValue1", "fieldName2": "fieldValue2", "lookupFieldName3_targetField@odata.bind": "/entitySetNameOfTarget(guidFieldValue3)", "lookupFieldName4@odata.bind": "/entitySetNameOfTarget(guidFieldValue4)"} </pre> <p>Sample JSON:</p> <pre>{ "customerid_account@odata.bind": "/accounts(0faa50fe-e7d0-4e9d-bdfd-3aacc2d9cbdd)", "name": "Order8", "shippingmethodcode": "4", "pricelevelid@odata.bind": "/pricelevels(10f883f4-8d0a-ea11-a811-000d3a1b1d16)"} </pre>
	Table Fields	If 'Accept Fields As JSON' is selected. Provide at least one 'Field Name' and 'Output Field'.
1	Field Name	Click on the cell in the input table, to populate fields associated with the entity name. The field data type is String. This is mandatory.
2	Field Value	Specify the value of the respective field associated with the Field Name. The field data type is String. This is mandatory.
3	Targets	Click on the cell in the input table, to populate targets associated with the Field Name.

Output Tab:		
No.	Field Name	Description
	Output Fields (Tabular):	

1	Updated Record IDs	Specify an output field to hold valid the IDs of updated records. Default value: UpdatedRecordIDs The field data type is String.
---	--------------------	--

15 FreshDesk

FreshDesk Plugin has been designed to perform tasks, such as create, delete, get, or update records on FreshDesk cloud instance.

Prerequisites

FreshDesk cloud instance with access details.

Note:

The number of API calls are based on subscription plan/API limit per endpoint.

<https://support.freshdesk.com/en/support/solutions/articles/225439-what-are-the-rate-limits-for-the-api-calls-to-freshdesk>

15.1 FreshDesk: Create Record

15.1.1 Description

FreshDesk: Create Record step creates a FreshDesk record.

15.1.2 References

To check the Field Value type required for the specified Field Name supported for the given Form Name, use the following links:

- https://developers.freshdesk.com/api/#filter_tickets
- https://developers.freshdesk.com/api/#create_ticket

15.1.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the FreshDesk cloud instance. For example, https://XXXXX.freshdesk.com . The field data type is String. This field is mandatory.
3	Accept value as variable/static	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list.

		Else enable checkbox for API Key field to appear as text box.
4	API Key	Specify the API Key to authenticate FreshDesk cloud instance. The field data type is String. This field is mandatory.
5	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Form Name	Specify the name of the form to create a specific record. The field data type is String. This field is mandatory.
2	Accept Fields As JSON	You can select the checkbox, if required. <ul style="list-style-type: none"> • If the Checkbox is selected, the 'JSON' field will be used to create the record. • If the checkbox is not selected 'Table Fields' will be used to build the JSON to create the record. The field data type is Checkbox. This field is mandatory.
3	JSON	Provide JSON in a valid format to create the record. For the JSON sample, see Annexure .
	Table Fields:	
1	Variable Field Name	Specify the value as a field or variable.
2	Static Field Name	Click the cell in the input table, fields associated with the form name will get populated.
3	Field Value	Specify the value of the respective field associated with the field name. The field data type is String. This field is mandatory.
4	Field Data Type	Specify the data type of the respective field associated with the field name. Allowed values: <i>'string', 'number', 'array of objects', 'array of strings', 'datetime', 'Integer', 'boolean', 'array of hashes', 'array', 'date'</i> .

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Record ID	Holds the ID of the record created in the FreshDesk cloud instance. Default value: RecordID

Note: The user must be authorized to access the specified form name.

15.1.4 Annexure

JSON sample syntax format

```
{
  "field1":integerValue1,"field2":"stringValue2", "field3":numberValue3,"field4": {
    arrayValue1, arrayValue2},
  "field5":["arrayOfHashKey1":arrayOfHashValue2],
  "field6":{arrayOfObjectValue1, arrayOfObjectValue2},
  "field7": ["arrayOfStringValue1", "arrayOfStringValue2"],
  "field8": "booleanValue8",
  "field9":"dateValue9",
  "field10":"dateTimeValue10"}

```

Sample JSON

15.2 FreshDesk: Delete Record

15.2.1 Description

FreshDesk: Delete Record step deletes one or more FreshDesk records matching the criteria query.

15.2.2 References

To check the Field Value type required for the specified Field Name supported for the given Form Name, use the following links:

- https://developers.freshdesk.com/api/#filter_tickets
- https://developers.freshdesk.com/api/#delete_a_ticket
- https://developers.freshdesk.com/api/#bulk_delete_tickets

15.2.3 Configurations

Configuration:		
No.	Field Name	Description

1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the FreshDesk cloud instance. For example, https://XXXXX.freshdesk.com. The field data type is String. This field is mandatory.
3	Accept value as variable/static	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as text box.
4	API Key	Specify the API Key to authenticate FreshDesk cloud instance. The field data type is String. This field is mandatory.
5	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:

No.	Field Name	Description
	Input Fields:	
1	Form Name	Specify the name of the form to get the matching records. The field data type is String. This field is mandatory.
2	Criteria Query	Provide the criteria query to fetch all FreshDesk records. For Criteria Query sample, see Annexure . The field data type is String. This field is mandatory. Note: You can fetch a maximum 300 records at a time.
3	Delete Multiple Records (Max: 300)	Select Yes or No. If you select Yes, multiple records matching the specified criteria is deleted. Note: <ul style="list-style-type: none"> • Default value is No. • You can delete a maximum 300 records at a time.

Output Tab:

No.	Field Name	Description
-----	------------	-------------

Output Fields:		
1	Delete Record IDs	Holds the ID of the deleted records in the FreshDesk cloud instance. Default value: DeletedRecordIDs

15.2.4 Annexure

Criteria query sample syntax format

"(ticket_field:integer OR ticket_field:'string') AND ticket_field:boolean"

Sample criteria query

- priority: 3
- status: 3 or status: 4
- group_id: 11
- (type:'Question' OR type:'Problem') AND (due_by:>'2017-10-01' AND due_by:<'2023-10-07')

15.2.5 Known issues

- Of the 300 records retrieved using the criteria query some records may be duplicate records. [API behavior]
- Out of 300, only distinct records will be deleted.

15.3 FreshDesk: Get Record By ID

15.3.1 Description

FreshDesk: Get Record By ID step fetches a FreshDesk record by ID.

15.3.2 Prerequisites

FreshDesk cloud instance with access details.

15.3.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
Connection:		
2	Base URL	Specify the base URL of the FreshDesk cloud instance. For example, https://XXXXX.freshdesk.com. The field data type is String. This field is mandatory.
3	Accept value as variable/static	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as text box.

4	API Key	Specify or select the API Key to authenticate FreshDesk cloud instance. The field data type is String. This field is mandatory.
5	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Form Name	Specify the name of the form to get the matching records. The field data type is String. This field is mandatory.
2	Record ID	Fetch a FreshDesk record with given record ID. The field data type is String. This field is mandatory.
3	Get	Click this button to get the list of record IDs associated with the Form Name on the FreshDesk. This list is populated if the connection is successfully established. Note: The number of records returned per page is 30.

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Field Name	On click of the cell in the output table, if the connection is successfully established it populates the list of fields associated with the Form Name and Criteria Query on the FreshDesk cloud instance. The field data type is String. This field is mandatory.
2	Output Field	Specify the valid values for the fields associated with the field name.

15.4 FreshDesk: Get Records Count

15.4.1 Description

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

FreshDesk: Get Records Count step will retrieve the count of FreshDesk records matching the criteria query.

15.4.2 References

To check the Field Value type required for the specified Field Name supported for the given Form Name, use the following links:

- https://developers.freshdesk.com/api/#filter_tickets

15.4.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the FreshDesk cloud instance. For example, https://XXXXX.freshdesk.com . The field data type is String. This field is mandatory.
3	Accept value as variable/static	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as text box.
4	API Key	Specify the API Key to authenticate FreshDesk cloud instance. The field data type is String. This field is mandatory.
5	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Form Name	Specify the name of the form to get the count of matching records. The field data type is String. This field is mandatory.
2	Criteria Query	Provide the criteria query to fetch all FreshDesk records. For sample criteria query, see Annexure .

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Total Records	Holds the count of records returned by given criteria. Default value: TotalRecords

15.4.4 Annexure Criteria query sample syntax format

"(ticket_field:integer OR ticket_field:'string') AND ticket_field:boolean"

Sample criteria query

- priority:3
- status:3 OR status:4
- group_id:11
- (type:'Question' OR type:'Problem') AND (due_by:>'2017-10-01' AND due_by:<'2023-10-07')

15.5 FreshDesk: Get Records

15.5.1 Description

FreshDesk: Get Record step fetches all FreshDesk records matching the criteria query.

15.5.2 References

To check the Criteria Query [Criteria Value type required for the specified Criteria Field] supported for the given Form Name, use the following link:

- https://developers.freshdesk.com/api/#filter_tickets

15.5.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the FreshDesk cloud instance. For example, https://XXXXX.freshdesk.com. The field data type is String. This field is mandatory.
3	Accept value as variable/static	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as text box.

4	API Key	Specify the API Key to authenticate FreshDesk cloud instance. The field data type is String. This field is mandatory.
5	Test Connection	Verifies whether the connection is established or not. Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Form Name	Specify the name of the form to get the matching records. The field data type is String. This field is mandatory.
2	Criteria Query	Provide the criteria query to fetch all FreshDesk records. For Criteria Query sample, see Annexure . The field data type is String. This field is mandatory. Note: You can fetch a maximum 300 records at a time.
3	Get Top N Records	Fetch the top N number of records returned by the criteria query. Note: You can fetch a maximum 300 records at a time.

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Field Name	On click of the cell in the output table, if the connection is successfully established it populates the list of fields associated with the Form Name and Criteria Query on the FreshDesk cloud instance. The field data type is String. This field is mandatory.
2	Output Field	Specify the valid values for the fields associated with the field name.

15.5.4 Annexure Criteria query sample syntax format

"(ticket_field:integer OR ticket_field:'string') AND ticket_field:boolean"

Sample criteria query

- priority: 3
- status: 3 or status: 4
- group_id: 11
- (type:'Question' OR type:'Problem') AND (due_by:>'2017-10-01' AND due_by:<'2023-10-07')

15.5.5 Known issues

Of the 300 records retrieved using the criteria query some records may be duplicate records.

[API behavior]

15.6 FreshDesk: Update Record

15.6.1 Description

FreshDesk: Update Record step updates one or more FreshDesk records matching the criteria query.

15.6.2 References

To check the Field Value type required for the specified Field Name supported for the given Form Name, use the following links:

- https://developers.freshdesk.com/api/#filter_tickets
- https://developers.freshdesk.com/api/#update_ticket
- https://developers.freshdesk.com/api/#bulk_update_tickets

15.6.3 Configurations

Configuration:		
No.	Field Name	Description
1	Step Name	Specify the name of the step. This name has to be unique in a single workflow.
	Connection:	
2	Base URL	Specify the base URL of the FreshDesk cloud instance. For example, https://XXXXX.freshdesk.com. The field data type is String. This field is mandatory.
3	Accept value as variable/static	Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as text box.
4	API Key	Specify the API Key to authenticate FreshDesk cloud instance. The field data type is String. This field is mandatory.

5	Test Connection	<p>Verifies whether the connection is established or not.</p> <p>Note: For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables.</p>
---	-----------------	---

Input Tab:		
No.	Field Name	Description
	Input Fields:	
1	Form Name	<p>Specify the name of the form to get the matching records.</p> <p>The field data type is String. This field is mandatory.</p>
2	Criteria Query	<p>Provide the criteria query to fetch all FreshDesk records. For sample criteria query, see Annexure.</p> <p>The field data type is String. This field is mandatory.</p> <p>Note: You can fetch a maximum 300 records at a time.</p>
3	Update Multiple Records (Max: 300)	<p>Select Yes or No. If you select Yes, multiple records matching the specified criteria are updated.</p> <p>Note:</p> <ul style="list-style-type: none"> • Default value is No. • You can update a maximum 300 records at a time.

Content to Update Tab:		
No.	Field Name	Description
	Content to Update Fields	
1	Accept Fields As JSON	<p>You can select the checkbox, if required.</p> <p>Note:</p> <ul style="list-style-type: none"> • If the Checkbox is selected, the 'JSON' field will be used to create the record. • If the checkbox is not selected 'Table Fields' will be used to build the JSON to create the record. <p>The field data type is Checkbox. This field is mandatory.</p>
2	JSON	<p>Provide JSON in a valid format to create the record. For the JSON sample, see Sample.</p>

		Note: This field is available only if the Accept Fields As JSON checkbox is selected.
	Table Fields:	
1	Variable Field Name	Select the value as a field or variable.
2	Static Field Name	Click the cell in the input table, fields associated with the form name will get populated.
3	Field Value	Select the value of the respective field associated with the field name. The field data type is String. This field is mandatory.
4	Field Data Type	Select the data type of the respective field associated with the field name. Allowed values: 'string', 'number', 'array of objects', 'array of strings', 'datetime', 'Integer', 'boolean', 'array of hashes', 'array', 'date'.

Output Tab:		
No.	Field Name	Description
	Output Fields:	
1	Updated Record IDs	Holds the ID of the updated records in the FreshDesk cloud instance. Default value: UpdatedRecordIDs Note: You can update a maximum of 300 record IDs.

15.6.4 Annexure

Criteria query sample syntax format:

"(ticket_field:integer OR ticket_field:'string') AND ticket_field:boolean"

Sample criteria query

- priority: 3
- status: 3 or status: 4
- group_id: 11
- (type:'Question' OR type:'Problem') AND (due_by:>'2017-10-01' AND due_by:<'2023-10-07')

## 15.7 FreshDesk: Upload Attachment

### 15.7.1 Description

FreshDesk: Upload Attachment step uploads an attachment to a FreshDesk record.

### 15.7.2 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                                                                                                                         |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                                                                                                             |
| 1              | Step Name                       | Specify the name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                          |
|                | Connection:                     |                                                                                                                                                                                                                                                                                                                                         |
| 2              | Base URL                        | Specify the base URL of the FreshDesk cloud instance. For example, https://XXXXX.freshdesk.com.<br><br>The field data type is String. This field is mandatory.                                                                                                                                                                          |
| 3              | Accept value as variable/static | Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as text box.                                                                                                                                                 |
| 4              | API Key                         | Specify the API Key to authenticate FreshDesk cloud instance.<br><br>The field data type is String. This field is mandatory.                                                                                                                                                                                                            |
| 5              | Test Connection                 | Verifies if the connection is established or not.<br><br><b>Note:</b> For the purpose of verification, fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. The Test Connection button will only work with static (hardcoded) values and environment variables. |

| Input Tab: |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|            | Input Fields:   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 1          | Form Name       | <p>Specify the name of the form to get the matching records.</p> <p>The field data type is String. This field is mandatory.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• The user must be authorized to access the specified form name.</li> <li>• Files uploaded on contact form are reflected as avatar icons.</li> <li>• For Avatar image of the contact, the maximum file size is 5MB and the supported file types are .jpg, .jpeg, .jpe, and .png.</li> <li>• The total size of attachments should not exceed 20MB.</li> </ul> |
| 2          | Record ID       | <p>Fetch a FreshDesk record with the provided record ID.</p> <p>The field data type is String. This field is mandatory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3          | Get             | <p>Click to populate the list of record IDs associated with the Form Name on FreshDesk. This list is populated if the connection is successfully established.</p> <p><b>Note:</b> The number of records returned per page is 30.</p>                                                                                                                                                                                                                                                                                                                    |
| 4          | Input File Path | <p>Provide full file path to upload. To provide multiple file paths, use comma separated values.</p> <p>The field data type is String. This field is mandatory.</p>                                                                                                                                                                                                                                                                                                                                                                                     |
| 5          | Browse          | Click to select the files to upload.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 16 Google Drive

Google Drive Plugin has been designed to perform tasks on Google Drive.

### Prerequisites:

- Google developer console account should be created - <https://console.developers.google.com/>.
- APIs for Google Drive should be enabled.
- Client ID and Client Secret should be generated from the Credentials tab. In exchange for the Client ID and Client Secret, a Refresh token can be generated.

### Note:

© 2023 AutomationEdge Inc All Rights Reserved.  
This document is for your company's internal use only and may not be distributed to any third party.

- For information about Refresh Token expiry, see <https://developers.google.com/identity/protocols/oauth2#expiration>
- The Get button fetches list of file or folder that belong to the owner only.
- For information about Google Supported MIME Type, see <https://developers.google.com/drive/api/v3/mime-types>

It is recommended that users *should not use* files or folders that are deleted or in trash or in the bin for any operations through Google Drive plugin.

## 16.1 Copy File

Google Drive: Copy File step copies a file to the provided destination folder ID of Google Drive.

### 16.1.1 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                           |
|-----|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step name                 | Name of the step as it appears in the workflow workspace. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                            |
|     | Connection:               | Refer Prerequisites and References above to get the connection attributes.                                                                                                                                                                                                                                                                                                                            |
| 2   | Client ID                 | Specify Client ID of the Google application. The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                                        |
|     | Client Secret:            |                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3   | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                      |
| 4   | Client Secret             | Specify Client Secret of the Google application.<br><br>Client Secret is entered using a widget. If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from. The data type is String. This field is mandatory. |
|     | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5   | Accept Values from fields | Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                         |
| 6   | Refresh Token             | Specify a Refresh Token to obtain a new Access Token.                                                                                                                                                                                                                                                                                                                                                 |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | <p><b>Note:</b><br/>Refresh Token is entered using a widget. If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from.<br/>The data type is String. This field is mandatory.</p>                                  |
| 7 | Test Connection | <p>Click Test Connection button to verify whether the connection is available or not.<br/>Client ID, Client Secret and Refresh Token are mandatory to authenticate Google Drive.<br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p> |

| Input Tab: |                       |                                                                                                                                                                                |
|------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name            | Description                                                                                                                                                                    |
|            | Input Fields:         |                                                                                                                                                                                |
| 1          | Source File ID        | Specify the ID of the file, which you want to copy.<br>The data type is String. This field is mandatory.<br>Refer <b>Table: Fetch File or Folder ID</b> above to fetch the ID. |
| 2          | Get                   | Click to fetch the files available in Google Drive. The selected file's ID appears in the <b>Source File ID</b> field.                                                         |
| 3          | Destination Folder ID | It is an ID of the folder in which the copy of the source file has to be made.<br>The data type is String. This field is mandatory.                                            |
| 4          | Get                   | Click to fetch the folders available in Google Drive. The selected folder's ID appears in the <b>Destination Folder ID</b> field.                                              |
| 5          | File Name After Copy  | Specify a new name for the copied file.<br>The data type is String. This field is optional.                                                                                    |

| Output Tab: |                |                                    |
|-------------|----------------|------------------------------------|
| No.         | Field Name     | Description                        |
|             | Output Field:  |                                    |
| 1           | Copied File ID | Returns the ID of the copied file. |

| No. | Field Name | Description |
|-----|------------|-------------|
|-----|------------|-------------|

| Input Fields: |                    |                                                                                                                                                                                                                      |
|---------------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1             | File ID            | Specify the ID of a file or a folder to be downloaded from the Google Drive.<br>The data type is String. This field is mandatory.<br><br>Refer <a href="#">Table: Fetch File or Folder ID</a> above to fetch the ID. |
| 2             | Get                | Click to fetch the files available in Google Drive, selected file's ID reflects in the <b>File ID</b> field.                                                                                                         |
| 3             | Output Folder Path | Specify the local Directory path where the file needs to be downloaded or alternately browse for the path.<br>The data type is String. This field is mandatory.                                                      |
| 4             | Browse             | Click to browse the path of the downloaded file.                                                                                                                                                                     |

Additional Input Tab:

| No.                                 | Field Name                                       | Description                                                                                                                                                                                                        |
|-------------------------------------|--------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Additional Input Fields (Optional): |                                                  |                                                                                                                                                                                                                    |
| 1                                   | Delete Output Folder Contents Before Downloading | Specify 'Yes' Or 'No'. Set 'Yes' to delete the contents of the output folder where the file is to be downloaded, else set 'No' to overwrite the duplicate file.<br>Default value is 'No'. The data type is String. |
| 2                                   | Add Date Timestamp for Duplicate Files           | Specify 'Yes' Or 'No'. Setting 'Yes' creates a new folder for the downloaded file with date and time stamp, else setting 'No' overwrites the duplicate file. Default value is 'No'. The data type is String.       |
| 3                                   | Add File To Result                               | Specify 'Yes' Or 'No'. Set 'Yes' to add the file to the Request result on AutomationEdge UI. Default value is 'No'. The data type is String.                                                                       |

Output Tab:

| No.                      | Field Name       | Description                                                                                                                   |
|--------------------------|------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Output Field (Optional): |                  |                                                                                                                               |
| 1                        | File Overwritten | Returns 'Yes' if the file is overwritten else returns 'No'.<br>The default value is FileOverwritten. The data type is String. |

## 16.5 Move File Or Folder

Google Drive: Move File Or Folder step moves a file or folder to the provided Destination Folder ID of Google Drive.

### 16.5.1 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 2   | Client ID                 | Specify Client ID of the Google application. The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                                             |
|     | Client Secret:            |                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3   | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                           |
| 4   | Client Secret             | Specify Client Secret of the Google application. The data type is String. This field is mandatory.<br><br>If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from.                                               |
|     | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                                                            |
| 5   | Accept Values from fields | Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                              |
| 6   | Refresh Token             | Specify a Refresh Token to obtain a new Access Token.<br><br>Refresh Token is entered using a widget. If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from. The data type is String. This field is mandatory. |

#### Input Tab:

| No. | Field Name | Description |
|-----|------------|-------------|
|-----|------------|-------------|

| Input Fields: |                |                                                                                                                                      |
|---------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------|
| 1             | File To Upload | Specify the local file path (e.g. C:\Text.txt) from where file has to be uploaded. The data type is String. This field is mandatory. |
| 2             | Button: Browse | Click to browse the file to be uploaded.                                                                                             |

#### Additional Input Tab:

| No.                      | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--------------------------|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Additional Input Fields: |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 1                        | Google Drive Folder ID          | Specify the parent folder ID where the file has to be Uploaded, chooses root folder if left blank. The data type is String.                                                                                                                                                                                                                                                                                                                                             |
| 2                        | Get                             | Click to fetch the folders available in Google Drive, selected folder's ID reflects in <b>Google Drive Folder ID</b> field.                                                                                                                                                                                                                                                                                                                                             |
| 2                        | File Name After Upload (Rename) | Specify the file name that should be set after file upload. The existing file name is used if this field is left blank. The data type is String.                                                                                                                                                                                                                                                                                                                        |
| 3                        | MIME Type After Upload          | Specify the MIME type of the file that should be set after upload, if left blank the step code tries to identify the original MIME type.<br><br><b>Note:</b> This steps attempts file conversion provided it is a Google supported MIME Type. The data type is String.<br><br>Please refer the following URL for Google Supported MIME Types: <a href="https://developers.google.com/drive/api/v3/mime-types">https://developers.google.com/drive/api/v3/mime-types</a> |

#### Output Tab:

| No.            | Field Name     | Description                                                                                    |
|----------------|----------------|------------------------------------------------------------------------------------------------|
| Output Fields: |                |                                                                                                |
| 1              | Upload File ID | Specify an output field to hold the Returned ID of the uploaded file. The data type is String. |

## 17 Google Sheets

Google Spreadsheets Plugin has been designed to perform tasks on spreadsheets on Google Drive.

**Prerequisites:**

- Google developer console account should be created and subscribed - <https://console.developers.google.com/>.
- APIs for Google Drive and Google Spreadsheet should be enabled.
- Client ID and Client Secret should be generated from the Credentials tab. In exchange for the Client ID and Client Secret, a Refresh Token can be generated.

**Note:**

- Google Spreadsheets plugin steps read from Google Drive. Google Drive differentiates between Excel files and Google Spreadsheet files. However, Google Spreadsheets plugin steps support only Google Spreadsheet files.

**References:**

Google Spreadsheet documentation  
<https://developers.google.com/sheets/api>

Refer [Appendix 10: Google Refresh Token Generation](#) for enabling APIs, creating Client ID and Client Secret and generating Refresh Token.

## 17.1 Append Row

### 17.1.1 Description

Google Spreadsheet: Append Spreadsheet Plugin Step appends rows to a spreadsheet on Google Drive.

### 17.1.2 Configurations

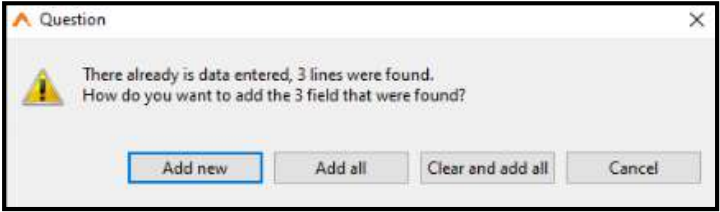

| No. | Field Name                | Description                                                                                                                                                                                      |
|-----|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step name                 | Name of the step as it appears in the workflow workspace. This name has to be unique in a single workflow.                                                                                       |
|     | Connection:               | Refer Prerequisites and References above to get the connection attributes.                                                                                                                       |
| 2   | Client ID                 | Specify Client ID of the Google application. The data type is String. This field is mandatory.                                                                                                   |
|     | Client Secret:            |                                                                                                                                                                                                  |
| 3   | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box. |
| 4   | Client Secret             | Specify Client Secret of the Google application.                                                                                                                                                 |

|   |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                           | <p>Client Secret is entered using a widget. If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from.</p> <p>The data type is String. This field is mandatory.</p>                                                                                                                                  |
|   | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 5 | Accept Values from fields | <p>Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.</p>                                                                                                                                                                                                                                                                                         |
| 6 | Refresh Token             | <p>Specify a Refresh Token to obtain a new Access Token.</p> <p><b>Note:</b><br/>Refresh Token expires if idle for 6 months.</p> <p>Refresh Token is entered using a widget. If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from.</p> <p>The data type is String. This field is mandatory.</p> |
| 7 | Button: Test Connection   | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state; only static values and environment variables are allowed.</p>                                                                                                                                                                                     |

| Input Tab: |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|            | Input Fields:  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 1          | Spreadsheet ID | <p>Specify the unique ID allocated to the spreadsheet. This ID is the value between the "/d/" and the "/edit" in the URL of your spreadsheet.</p> <p>For example, Spreadsheet ID reference URL - For example, consider the following URL that references a Google Sheets spreadsheet:<br/> <a href="https://docs.google.com/spreadsheets/d/1CJnka15pj3SLpv-HdmyguX/edit#gid=0">https://docs.google.com/spreadsheets/d/1CJnka15pj3SLpv-HdmyguX/edit#gid=0</a><br/>                     Then, Spreadsheet ID is: 1CJnka15pj3SLpv- HdmyguX) as highlighted above.</p> |

|   |            |                                                               |
|---|------------|---------------------------------------------------------------|
| 2 | Sheet Name | The unique name of the sheet such as Sheet1, Sheet2 likewise. |
|---|------------|---------------------------------------------------------------|

|     | Button: Get Fields | Click this button to fetch the field values from previous steps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 1   | Table Fields:      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|     | Name               | <p>Specify the field Names (or Columns) for the rows you wish to append. Names are populated by clicking the Get Fields button above from previous steps in the workflow stream. You may keep all field Names populated or remove some field names for the rows you wish to append to this sheet.</p> <p>There are other scenarios while working with this step. You may use the Get Fields button above to fetch field Names. You may click on this button again for any reasons such as new fields in the workflow stream etc. In such a case if data is already present in the step a pop-up window is displayed with four options as seen in the snapshot below.</p>  <p>You may choose to add only new rows, Add all rows again, Clear existing rows and add all rows or cancel Get Fields button.</p> |
| 2   | Type               | <p>The data Type of field Names above. Type values are only for user information purposes on plugin window.</p> <p><b>Note:</b><br/>At least one combination of Name and Type should be provided.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 17.2 Copy Sheet

Google Spreadsheet: Copy Sheet Plugin Step, copies a sheet from one spreadsheet to same or another spreadsheet on Google drive.

### 17.2.1 Configurations

| No. | Field Name | Description |
|-----|------------|-------------|
|-----|------------|-------------|

|   |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step name                 | Name of the step as it appears in the workflow workspace. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                          |
|   | Connection:               | Refer Prerequisites and References above to get the connection attributes.                                                                                                                                                                                                                                                                                                                                                          |
| 2 | Client ID                 | Specify Client ID of the Google application.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                                                                   |
|   | Client Secret:            |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3 | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                                                    |
| 4 | Client Secret             | Specify Client Secret of the Google application.<br><br>If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from.<br>The data type is String. This field is mandatory.                                                                     |
|   | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 5 | Accept Values from fields | Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                                                       |
| 6 | Refresh Token             | Specify a Refresh Token to obtain a new Access Token.<br><br><b>Note:</b><br>Refresh Token expires if idle for 6 months.<br>If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from.<br>The data type is String. This field is mandatory. |
| 7 | Button: Test Connection   | Verifies whether the connection is established or not.<br><br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state; only static values and environment variables are allowed.                                                                                                                                   |

Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from. The data type is String. This field is mandatory.</p>                                                                          |
|   | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 5 | Accept Values from fields | <p>Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.</p>                                                                                                                                                                                                                                         |
| 6 | Refresh Token             | <p>Specify a Refresh Token to obtain a new Access Token.</p> <p><b>Note:</b><br/>Refresh Token expires if idle for 6 months.</p> <p>If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from. The data type is String. This field is mandatory.</p> |
| 7 | Button: Test Connection   | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state; only static values and environment variables are allowed.</p>                                                                                                                                     |

| Input Tab: |                |                                                                                                                                                                                                                                                                                                                                       |
|------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name     | Description                                                                                                                                                                                                                                                                                                                           |
|            | Input Fields:  |                                                                                                                                                                                                                                                                                                                                       |
| 1          | Spreadsheet ID | <p>Specify a Spreadsheet ID of the spreadsheet on which the sheet is present. The data type is String. This field is mandatory.</p> <p><b>Note:</b><br/><b>To get a spreadsheet ID:</b><br/>In the URL, the spreadsheet ID is the value between "/d/" and "/edit" in the URL of the spreadsheet, as shown in the following image:</p> |

|   |             |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |             |  <p>For example, consider the following URL that refers a Google Sheets spreadsheet:<br/> <a href="https://docs.google.com/spreadsheets/d/1CJnka15pj3SLpv-HdmyguX/edit#gid=0">https://docs.google.com/spreadsheets/d/1CJnka15pj3SLpv-HdmyguX/edit#gid=0</a><br/>                 Then the Spreadsheet ID is <b>1CJnka15pj3SLpv- HdmyguX</b>.</p> |
| 2 | Sheet Name  | Specify the Sheet name to fetch its sheet ID, or click the Get button as mentioned below.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                     |
| 3 | Button: Get | Click the Get button to get the list of sheet names in the Spreadsheet.                                                                                                                                                                                                                                                                                                                                                            |

| Output Tab: |               |                                                                                                             |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------|
| No.         | Field Name    | Description                                                                                                 |
|             | Output Field: |                                                                                                             |
| 1           | Sheet ID      | Specify an output field to hold the returned Sheet ID.<br>The date type is string. This field is mandatory. |

| Common Buttons: |            |                                                                                                                                                                                                                                            |
|-----------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                                |
|                 | Buttons:   |                                                                                                                                                                                                                                            |
| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                              |

## 17.7 Read

### 17.7.1 Description

Google Spreadsheets: Read step reads a spreadsheet on Google Drive.

|-----|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step name                 | Name of the step as it appears in the workflow workspace. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                            |
|     | Connection:               | Refer Prerequisites and References above to get the connection attributes.                                                                                                                                                                                                                                                                                                                                                                                            |
| 2   | Client ID                 | Specify Client ID of the Google application.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                     |
|     | Client Secret:            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3   | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                                                                                      |
| 4   | Client Secret             | Specify Client Secret of the Google application.<br>Client Secret is entered using a widget. If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from.<br>The data type is String. This field is mandatory.                                                                  |
|     | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5   | Accept Values from fields | Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                                                                                         |
| 6   | Refresh Token             | Specify a Refresh Token to obtain a new Access Token.<br><b>Note:</b> Refresh Token expires if idle for 6 months.<br>Refresh Token is entered using a widget. If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from.<br>The data type is String. This field is mandatory. |
| 7   | Button: Test Connection   | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state; only static values and environment variables are allowed.                                                                                                                                                                         |

| Input Tab: |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|------------|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|            | Input Fields:  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1          | Spreadsheet ID | <p>Specify the unique ID allocated to the spreadsheet. This ID is the value between the "/d/" and the "/edit" in the URL of your spreadsheet.</p> <p>For example, Spreadsheet ID reference URL - For example, consider the following URL that references a Google Sheets spreadsheet:<br/> <a href="https://docs.google.com/spreadsheets/d/1CJnka15pj3SLpv-HdmyguX/edit#gid=0">https://docs.google.com/spreadsheets/d/1CJnka15pj3SLpv-HdmyguX/edit#gid=0</a></p> <p>Then, Spreadsheet ID is: 1CJnka15pj3SLpv- HdmyguX) as highlighted above.</p> |
| 2          | Range          | <p>Range should be provided in A1 notation.</p> <p>This is a string like Sheet1!A1:B2, that refers to a group of cells in the spreadsheet, and is typically used in formulas.</p>                                                                                                                                                                                                                                                                                                                                                                |
| 3          | Has Header?    | <p>Allowed values are 'Yes' or 'No'. Set "Yes" if header row is present in the retrieved data.</p> <p>If this option is set to 'Yes', then values present in all columns in the first row will be populated in Field Name in the Output tab below; else dummy column names such as Field_000, Field_001 and so on will be populated.</p>                                                                                                                                                                                                         |

| Output Tab: |                           |                                                                                                                                                                                                                                                                                                                                                                                                              |
|-------------|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.         | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1           | Button: Get Output Fields | <p>Click this button to populate header field names (or columns) to be read from spreadsheet in the tabular Field Names below.</p> <p><b>Note:</b> On an ongoing basis please click Get Output Fields button to after any change in any of the above input fields.</p>                                                                                                                                       |
|             | Table Fields:             |                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2           | Field Name                | <p>Specify the Field Names (or columns) to fetch from the range specified in the input Tab. The Field Names are fetched by clicking the Get Output Fields button above. You may Keep all the Field Names retrieved or deleted the fields names not required.</p> <p>If 'Has Header' is set to Yes in the Input Tab, then values present in all columns in the first row are populated in the Field name.</p> |

|   |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                   | <p>If 'Has Header' is set to No, then the dummy column names such as Field_000, Field_001 and so on are populated.</p> <p>The following is true of the rows of data read from the range specified,</p> <ul style="list-style-type: none"> <li>• If Has Header=Yes and you wish to fetch the columns of rows data that do not have a value in the first row of header Field Name then alternatively provide an Output Field Name below, to match the columns of rows data.</li> <li>• In case of merged cells, the value is assigned to the top left cell.</li> <li>• In a row, if a cell is empty it is marked as <b>&lt;null&gt;</b>, and also in case there are no consecutive cells having data after that cell then the value of such cells is also marked as <b>&lt;null&gt;</b>.</li> </ul> <p><b>Note:</b> At least one combination of Field Name and Output Field Name should be provided.</p> |
| 3 | Output Field Name | <p>You may specify desirable names for the Field Names above; especially when 'Has Header'=No and Field Names do not represent appropriate business names.</p> <p><b>Note:</b> At least one combination of Field Name and Output Field Name should be provided.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 18 Google Workspace

Google Workspace plugin has been designed to perform tasks with users, groups, and password in the Google Workspace.

### Prerequisites

- Create Google developer console account. Use the following link to create the account, <https://console.developers.google.com/>.
- Enable APIs for Google Admin SDK.
- Client ID and Client Secret should be generated from the Credentials tab. In exchange for the Client ID and Client Secret, a Refresh token can be generated.

### References

Google Workspace documentation, <https://developers.google.com/admin-sdk/directory>.

#### Note:

For creating Client ID, Client Secret, and generating Refresh Token, see [Annexure 18: Google Token Generation](#).

## 1.1 Google Workspace: Add Alias To User

Google Workspace: Add Alias To User step, adds an alias to the user present on the Google Workspace.

### 1.1.1 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step name                 | Name of the step as it appears in the workflow workspace. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                       |
|     | Connection:               |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2   | Client ID                 | Specify Client ID of the Google application. The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                                                                   |
|     | Client Secret:            |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3   | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                                                 |
| 4   | Client Secret             | Specify Client Secret of the Google application.<br><br>If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from. The data type is String. This field is mandatory.                                                                     |
|     | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5   | Accept Values from fields | Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                                                                                    |
| 6   | Refresh Token             | Specify a Refresh Token to obtain a new Access Token.<br><b>Note:</b><br>Refresh Token expires if idle for 6 months.<br><br>If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from. The data type is String. This field is mandatory. |
| 7   | Button: Test Connection   | Verifies whether the connection is established or not.<br><br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be                                                                                                                                                                                                                                      |

|  |  |                                                                                                       |
|--|--|-------------------------------------------------------------------------------------------------------|
|  |  | accessed when workflow is in running state; only static values and environment variables are allowed. |
|--|--|-------------------------------------------------------------------------------------------------------|

| No.             | Field Name | Description                                                                                                                                       |
|                 | Buttons:   |                                                                                                                                                   |
| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message. |

|   |        |                                                                                   |
|---|--------|-----------------------------------------------------------------------------------|
|   |        | If all the required field values are provided then it will save the field values. |
| 2 | Cancel | On click of this button, it will cancel the window and do not save any values.    |

## 1.8 Google Workspace: Has Member In Group

Google Workspace: Has Member In Group step, checks if the Member exists in a group present on the Google Workspace.

### 1.8.1 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                         |
|-----|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step name                 | Name of the step as it appears in the workflow workspace. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                          |
|     | Connection:               |                                                                                                                                                                                                                                                                                                                                                                     |
| 2   | Client ID                 | Specify Client ID of the Google application. The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                      |
|     | Client Secret:            |                                                                                                                                                                                                                                                                                                                                                                     |
| 3   | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                    |
| 4   | Client Secret             | Specify Client Secret of the Google application.<br><br>If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down containing values from previous steps - to select from.<br><br>The data type is String. This field is mandatory. |
|     | Refresh Token:            |                                                                                                                                                                                                                                                                                                                                                                     |
| 5   | Accept Values from fields | Leave checkbox unchecked to accept Secret Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Secret Key field to appear as Text box.                                                                                                                                                                       |
| 6   | Refresh Token             | Specify a Refresh Token to obtain a new Access Token.                                                                                                                                                                                                                                                                                                               |

|   |                         |                                                                                                                                                                                                                                                                                                                                                                              |
|---|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                         | <p>Note:<br/>Refresh Token expires if idle for 6 months.</p> <p>If checkbox above is enabled Refresh Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Refresh Token field appears as a drop down containing values from previous steps - to select from.<br/>The data type is String. This field is mandatory.</p> |
| 7 | Button: Test Connection | <p>Verifies whether the connection is established or not.</p> <p>Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state; only static values and environment variables are allowed.</p>                                                                            |

| Input Tab: |                                                        |                                                                                                                                                      |
|------------|--------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

## 19 Intune

Microsoft Intune is a cloud-based service that focuses on mobile device management (MDM) and mobile application management (MAM). You control how your organization’s devices are used, including mobile phones, tablets, and laptops. Intune plugin has been designed to perform Intune tasks.

**Prerequisites:**

- Create Intune instance with access details and Intune Credentials - On Azure Portal: <https://portal.azure.com/>

- Create Credentials for Intune:

Steps to generate Credentials (Tenant ID and Client ID and Client Secret):

- ✓ Credentials for Intune include Tenant ID, Client ID and Client Secret.
- ✓ Login to Azure AD with Global Administrator account type. Global Administrator account type can access all the managed content (Devices and Applications) APIs by creating an application.
- ✓ Use the portal (portal.azure.com) to create an Azure AD Application and Service Principal (Global Administrator) that can access resources. **Note:** the Tenant ID and Client ID of the Application.
- ✓ Create a new Application Secret/Client Secret.

- **The following permissions are required:**

| Permission type | Permission (from least to most privileged)                                                            |
|-----------------|-------------------------------------------------------------------------------------------------------|
| Application     | DeviceManagementManagedDevices.PrivilegedOperations.All, DeviceManagementManagedDevices.ReadWrite.All |

Refer [Appendix 11: Intune- Generate Client Credentials](#) to generate Credentials and assign the permissions mentioned in the table above.

- Supported operating systems and browsers in Intune <https://docs.microsoft.com/en-us/mem/intune/fundamentals/supported-devices-browsers>

**Note:s:**

- The Plugin has been tested on Android and Windows devices

- Remote lock operation is not supported by 'Windows' devices, so Remote Lock By Device ID/Username plugins are not applicable for Windows devices.
- Device ID Type: 'Phone number' and 'IMEI' is only supported for cellular devices.

## 19.1 Intune: Delete Device By ID

### 19.1.1 Description

Intune: Delete Device By ID plugin step sends a Device Delete command to the devices identified by device ID and Deletes the device.

### 19.1.2 Configurations

| Configuration: |                           |                                                                                                                                                                                                                                                                                                                                          |
|----------------|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                | Description                                                                                                                                                                                                                                                                                                                              |
| 1              | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                       |
|                | Connection:               |                                                                                                                                                                                                                                                                                                                                          |
| 2              | Tenant ID                 | Specify Tenant ID.<br>The field data type is String. This is mandatory.<br><b>Note:</b> To create Tenant ID refer plugin prerequisites.                                                                                                                                                                                                  |
| 3              | Client ID                 | Specify Client ID.<br>The field data type is String. This is mandatory.<br><b>Note:</b> To create Client ID refer plugin prerequisites.                                                                                                                                                                                                  |
|                | Client Secret:            | <b>Note:</b> To create Client Secret refer the plugin prerequisites.                                                                                                                                                                                                                                                                     |
| 4              | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                      |
| 5              | Client Secret             | Provide the Client Secret.<br>If checkbox above is enabled Client Secret field appears as Text box and accepts static values or environment variables. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.<br><br>The field data type is String This field is mandatory. |
| 6              | Test Connection           | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                 |

#### Input Tab:

| No. | Field Name     | Description                                                                                                                                                                                                            |
|-----|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Input Fields:  |                                                                                                                                                                                                                        |
| 1   | Device ID Type | Specify type of Device ID of the Device to be deleted.<br>Allowed values: 'Intune Device ID', 'Azure AD Device ID', 'IMEI', 'Serial number', 'Phone number'.<br>The field data type is String This field is mandatory. |
| 2   | Device ID      | Specify Device ID which is a unique identifier that identifies the device.<br>The field data type is String This field is mandatory.<br><b>Note:</b> Device ID should be valid and must not be Zero (0).               |

## 19.2 Intune: Remote Lock Device By ID

### 19.2.1 Description

Intune: Remote Lock Device By ID plugin step locks a device in Intune remotely, by Device ID.

### 19.2.2 Configurations

| Configuration: |                           |                                                                                                                                                                                                                                                                |
|----------------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                | Description                                                                                                                                                                                                                                                    |
| 1              | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                             |
|                | Connection:               |                                                                                                                                                                                                                                                                |
| 2              | Tenant ID                 | Specify Tenant ID.<br>The field data type is String. This is mandatory.<br><b>Note:</b> To create Tenant ID refer plugin prerequisites.                                                                                                                        |
| 3              | Client ID                 | Specify Client ID.<br>The field data type is String. This is mandatory.<br><b>Note:</b> To create Client ID refer plugin prerequisites.                                                                                                                        |
|                | Client Secret:            | <b>Note:</b> To create Client Secret refer plugin prerequisites.                                                                                                                                                                                               |
| 4              | Accept Values from fields | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Client Secret field to appear as Text box.                                                         |
| 5              | Client Secret             | Provide the Client Secret.<br>If checkbox above is enabled Client Secret field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps. |

| 2          | Device ID      | Specify Device ID which is a unique identifier that identifies the device.<br>The field data type is String This field is mandatory.<br><b>Note:</b> Device ID should be valid and must not be Zero (0).   |

## 20 Ivanti Service Manager

Ivanti Service Manager plugin has been designed to perform tasks with business objects in Ivanti Service Manager.

### Prerequisite

Ivanti Service Manager instance with access details.

## 20.1 Ivanti Service Manager: Create Business Object

Ivanti Service Manager: Create Business Object step, creates a business object record in Ivanti Service Manager.

**Limitation:** The service request business object record cannot be created using this plugin step since there is a different API endpoint provided to create service request.

|             | Output Fields: |                                                                                                   |
| 1           | Rec ID         | Specify the output field to hold the Rec ID of the record created on successful plugin execution. |

**Common Buttons:**

| No. | Field Name | Description                                                                                                                                                                                                                                |
|-----|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Buttons:   |                                                                                                                                                                                                                                            |
| 1   | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2   | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

### 20.1.2 Sample

```
{ "Category": "Compute", "CreatedBy": "Admin", "Description": "Test", "Owner": "Andrew I. Smythe", "OwnerTeam": "Application Development", "TypeOfChange": "minor", "Subject": "Test Record" }
```

## 20.2 Ivanti Service Manager: Delete Business Object

Ivanti Service Manager: Delete Business Object step, deletes a business object record in Ivanti Service Manager.

**Limitation:** The service request business object record cannot be deleted using this plugin step since there is a different API endpoint provided to create service request.

Else if checkbox above is disabled API Key field appears as a drop down containing values from previous steps to select from.<br>The data type is String. This field is mandatory. |

Input Tab:

| No. | Field Name      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Input Fields:   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 1   | Business Object | Specify the internal name of the Business Object for which record is to be deleted.<br>The data type is String. This field is mandatory.<br><br><b>Note:</b> Locate the internal name using the following steps: <ol style="list-style-type: none"> <li>i. Click on Settings icon at the right uppermost corner.</li> <li>ii. Select Business Objects under Build option.</li> <li>iii. In the Find box, type the display name of the Business Object and you can see the internal name enclosed in the bracket just under Display Name.</li> </ol> |
| 2   | Rec ID          | Select rec ID of the record to be deleted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|     | Button: Get     | On clicking the Get button, Rec IDs associated with the business object will get populated.<br><br><b>Note:</b> Get button will not work for the previous step variables. The button will only work with static values and environment variables.                                                                                                                                                                                                                                                                                                   |

Common Buttons:

| No. | Field Name | Description |
|-----|------------|-------------|
|     | Buttons:   |             |

|   |        |                                                                                                                                                                                                                                                   |
|---|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | OK     | <p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p> |
| 2 | Cancel | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                                    |

## 20.3 Ivanti Service Manager: Search

Invanti Service Manager: Search step, fetches business object records based on the Full-Text (Keyword) / Criteria Query.

### Limitation:

- The service request business object record cannot be searched using this plugin step since there is a different API endpoint provided to create service request.
- Few queries that have more than one operators (nested queries) may not provide correct output. For example, Priority eq '1' AND CauseCode eq 'Configuration' OR Approver eq 'AEApprover' AND Owner ne '\$NULL'.
- If the query is to be provided as **Owner ne '\$NULL' OR (Priority eq '1' AND Approver eq 'AEApprover')** as per the UI, it needs to be provided as **Priority eq '1' AND Approver eq 'AEApprover' OR Owner ne '\$NULL'** in the plugin as well as API. However, in API adding brackets is not allowed hence user may get incorrect results.

|-----------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                                |
|                 | Buttons:   |                                                                                                                                                                                                                                            |
| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

### 20.3.2 Sample Criteria Query

- Priority eq '1'
- Status eq 'Active' AND Owner eq 'Alan Taylor'
- ActualCategory eq 'Backup' AND CauseCode eq 'Installation' OR Cost It '100'

**Note:**

Operators to be used in Criteria Query:

|          |    |
|----------|----|
| Equal to | eq |
|----------|----|

|                  |    |
|------------------|----|
| Not equal to     | ne |
| Greater than     | gt |
| Greater or Equal | ge |
| Less than        | lt |
| Less or Equal    | le |

## 20.4 Ivanti Service Manager: Update Business Object

Ivanti Service Manager: Update Business Object step, updates a business object record in Ivanti Service Manager.

**Limitation:** The service request business object record cannot be updated using this plugin step since there is a different API endpoint provided to update service request.

|            | Input Fields:         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 1          | Business Object       | <p>Specify the internal name of the Business Object for which record is to be updated.<br/>The data type is String. This field is mandatory.</p> <p><b>Note:</b> Locate the internal name using the following steps:</p> <ol style="list-style-type: none"> <li>i. Click on Settings icon at the right uppermost corner.</li> <li>ii. Select Business Objects under Build option.</li> <li>iii. In the Find box, type the display name of the Business Object and you can see the internal name enclosed in the bracket just under Display Name.</li> </ol> |
| 2          | Rec ID                | Select the Rec ID of the record to be updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|            | Button: Get           | Click to get the list of record IDs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3          | Accept Fields As JSON | Select the checkbox, to use the JSON field as an input to build JSON. If it is not selected, use the table input to build the JSON.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4          | JSON                  | <p>Select the JSON in a valid format to update a record. For sample JSON, see <a href="#">Sample</a>.</p> <p><b>Note:</b> This field is available only if Accept Fields As JSON checkbox is selected. If this field is available then it is a mandatory field.</p>                                                                                                                                                                                                                                                                                          |
|            | Table Fields          | The table fields are available only if Accept Fields As JSON checkbox is not selected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 1          | Variable Field Name   | Select the field name as a field or variable. This is an optional field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2          | Static Field Name     | On clicking the cell in the input table, fields associated with the business object will get populated.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3          | Field Value           | Select valid values for the field associated with the field name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Common Buttons: |            |                                                                                                                                                                                                                                            |
|-----------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                                |
|                 | Buttons:   |                                                                                                                                                                                                                                            |
| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

### 20.4.2 Sample

```
{"Category":"Compute","CreatedBy":"Admin","Description":"Test","Owner":"Andrew I. Smythe","OwnerTeam":"Application Development","TypeOfChange":"minor","Subject":"Test Record"}
```

**Note:**

Operators to be used in Criteria Query:

|                  |    |
|------------------|----|
| Equal to         | eq |
| Not equal to     | ne |
| Greater than     | gt |
| Greater or Equal | ge |
| Less than        | lt |
| Less or Equal    | le |

## 20.5 Ivanti Service Manager: Upload Attachment

Ivanti Service Manager: Upload Attachment uploads one or more attachments to a business object record in Ivanti Service Manager.

### 20.5.1 Configurations

| No. | Field Name  | Description                                                                                                                                                                                                                                                                                                                                       |
|-----|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step name   | Name of the step as it appears in the workflow workspace. This name has to be unique in a single workflow.                                                                                                                                                                                                                                        |
|     | Connection: |                                                                                                                                                                                                                                                                                                                                                   |
| 2   | Tenant URL  | Tenant URL of Ivanti Service Manager instance. The data type is String. This field is mandatory.                                                                                                                                                                                                                                                  |
| 3   | API Key     | Specify or select API Key generated for the tenant.<br><br>If checkbox above is enabled API Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled API Key field appears as a drop down containing values from previous steps to select from. The data type is String. This field is mandatory. |

| Input Tab: |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | Input Fields:   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1          | Business Object | Specify the internal name of the Business Object to which file is to be attached.<br>The data type is String. This field is mandatory.<br><br><b>Note:</b> Locate the internal name using the following steps: <ol style="list-style-type: none"> <li>i. Click on Settings icon at the right uppermost corner.</li> <li>ii. Select Business Objects under Build option.</li> <li>iii. In the Find box, type the display name of the Business Object and you can see the internal name enclosed in the bracket just under Display Name.</li> </ol> |
| 2          | Rec ID          | Select Rec ID of the record to which the attachment is to be uploaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

## 21 Jenkins

This plugin is designed to perform Jenkins actions. The tasks are handled by the plugin steps as discussed below.

### Compatibility:

- This plugin has been tested on Jenkins ver. 2.176.2 (installed using jenkins.war)

### Prerequisites:

- Jenkins instance and access details

This plugin is designed to perform Jenkins actions. The tasks are handled by the plugin steps as discussed below.

**Compatibility:**

- This plugin has been tested on Jenkins ver. 2.176.2 (installed using jenkins.war)

**Prerequisites:**

- Jenkins instance and access details

**21.1 Jenkins: Build Job****21.1.1 Description**

Jenkins: Build Job step builds a job with parameters or without parameters.

**21.1.2 Configurations**

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 22 Jira

This plugin is designed to perform various tasks on a JIRA instance. These tasks are handled by the plugin steps as discussed below.

This plugin has been tested with JIRA-8.6.1, JIRA -8.0.2, JIRA-7.13.0 (On-Premise) and JIRA-(On-Cloud).

### Prerequisites:

- JIRA instance and access details with appropriate permissions.
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.
- Get an API Key in case of on cloud instance.

Following is the link to find the steps to generate token for on-cloud JIRA instance:

<https://confluence.atlassian.com/cloud/api-tokens-938839638.html>

### 22.1 Jira: Add Comment

#### 22.1.1 Description

JIRA Add Comment plugin step adds a new comment to an issue in On-premise and On-cloud version of a Jira instance.

### 22.1.2 Configurations

| No.        | Field Name    | Description                                                                                                                                                                                                                                                                                                                                    |
|            | Input Fields: |                                                                                                                                                                                                                                                                                                                                                |
| 1          | Issue Key     | <p>Issue key of the issue for which label is to be added. This field is mandatory.</p> <p><b>Note:</b><br/>REST API can get maximum of 1000 and 100 issues for on-premise and on-cloud instances respectively. This is an intentional limitation on JIRA applications to avoid performance-related issues such as an OutOfMemoryException.</p> |
| 2          | Button: Get   | Clicking on this button brings up the issue keys available as per the access permission of Username provided in Connection.                                                                                                                                                                                                                    |
| 3          | Label         | Specify a label value to be added to an issue. This field is mandatory.                                                                                                                                                                                                                                                                        |

## 22.3 Jira: Add User to Group

### 22.3.1 Description

Jira: Add User To Group plugin step adds a user to a group on on-premise or on-cloud versions of a JIRA software instance.

#### Prerequisites:

© 2023 AutomationEdge Inc All Rights Reserved.  
This document is for your company's internal use only and may not be distributed to any third party.

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.3.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2   | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and change user password. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|     | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 4   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5   | Password/API Key                | Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance<br><br>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br><br><b>Note:</b><br>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a> |
| 6   | Test Connection                 | Verifies whether the connection is established or not.<br><br><b>Note:</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|  |  |                                                                                                                                                                                                                   |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|------------|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name          | Description                                                                                                                                                                                                                                                                                                                                                               |
|            | Input Fields:       |                                                                                                                                                                                                                                                                                                                                                                           |
| 1          | Username/Account ID | Username of the user to be added to a specific Group. The data type is String. This field is mandatory.<br><br><b>Note:</b><br>Account ID can be found in the URL of the cloud instance when you open user profile. (e.g. <a href="https://admin.atlassian.com/s/68f0ebf6b0dded/users/5e4d195e9706">https://admin.atlassian.com/s/68f0ebf6b0dded/users/5e4d195e9706</a> ) |
| 2          | Group Name          | Specify the Group name in which the user is to be added. Groups displayed on Get button is set to max limit of 100. The data type is String. This field is mandatory.                                                                                                                                                                                                     |
| 3          | Button: Get         | Clicking on this button brings up the list of Group Names. Groups displayed on the Get button are set to a max limit of 100.                                                                                                                                                                                                                                              |

## 22.4 Jira: Attach File to Issue

### 22.4.1 Description

This plugin attaches a file to an issue in on premise or on-cloud version of JIRA Software.

#### Prerequisites:

- JIRA instance (JIRA-8.0.2 (On-Premise) and JIRA (On-Cloud)) and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.4.2 Configurations

| No. | Field Name  | Description                                                                                                                                                                          |
|-----|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow.                                                                                                                   |
|     | Connection: |                                                                                                                                                                                      |
| 2   | Base URL    | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration. |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                 | In case of Cloud instance specify the JIRA instance URL (e.g. <a href="https://xxxx.atlassian.net/">https://xxxx.atlassian.net/</a> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3 | Username                        | A username with appropriate permissions to authenticate to JIRA instance and attach file to an issue. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|   | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5 | Password/API Key                | <p>Password can be entered as Text (for static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p>Provide an API Key in case of on cloud instance.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 6 | Test Connection                 | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Input Tab: |               |                                                                                                                                                                                                                                                                                                      |
|------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name    | Description                                                                                                                                                                                                                                                                                          |
|            | Input Fields: |                                                                                                                                                                                                                                                                                                      |
| 1          | Issue Key     | <p>Issue Key of the issue to be deleted.</p> <p><b>Note:</b><br/>REST API can get maximum of 1000 and 100 issues for on-premise and on-cloud instances respectively. This is an intentional limitation on JIRA applications to avoid performance-related issues such as an OutOfMemoryException.</p> |

|   |                        |                                                                                                                             |
|---|------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 2 | Button: Get            | Clicking on this button brings up the issue keys available as per the access permission of Username provided in Connection. |
| 3 | File                   | File path of the file to be attached to the issue.                                                                          |
| 4 | Button: Browse File... | Clicking on this button brings up the dialog to browse the file which is to be attached to the issue.                       |

## 22.5 Jira: Change User Password (Server)

### 22.5.1 Description

Jira Change User Password plugin step changes the user password in an instance of Jira Software.

#### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.5.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                         |
|-----|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                  |
|     | Connection:                     |                                                                                                                                                                                                                                                                                     |
| 2   | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/). |
| 3   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and change user password. This field is mandatory.                                                                                                                                                         |
|     | Password:                       |                                                                                                                                                                                                                                                                                     |
| 4   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                           |
| 5   | Password                        | Provide password of the username to authenticate to an on premise instance<br><br>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop                                                                           |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | <p>down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |

|            | Input Fields: |                                                                                                         |
| 1          | Username      | Username of the user whose password is to be changed. The data type is String. This field is mandatory. |
| 2          | New Password  | New password to be set for the specific user. The data type is String. This field is mandatory.         |

## 22.6 Jira: Create Group

Jira Create Group plugin step creates a group in an instance of Jira Software.

### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.6.1 Configurations

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2 | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3 | Username                        | A username with appropriate permissions to authenticate to JIRA instance and create group. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|   | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 5 | Password/API Key                | Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance<br><br>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br><br><b>Note:</b><br>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a> |
| 6 | Test Connection                 | Verifies whether the connection is established or not.<br><br><b>Note:</b><br>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Input Tab: |               |             |
|------------|---------------|-------------|
| No.        | Field Name    | Description |
|            | Input Fields: |             |

|   |            |                                                                                                                                                                                                                                                                                                                                                                            |
|---|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Group Name | <p>Name of the new Jira Group to be created. The data type is String. This field is mandatory.</p> <p><b>Known Issue:</b><br/>For cloud instance, if multiple groups are created within a short time span (say through Excel input or using a loop), it may give “Internal server error”. This issue can be minimized by adding an appropriate delay before this step.</p> |
|---|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 22.7 Jira: Create Issue

### 22.7.1 Description

“Jira Create Issue” plugin step creates an issue in an on-premise or on-cloud version of a JIRA instance.

#### Limitations:

The following fields are unsupported: *Time Tracking*, *Original Estimate*, and *Remaining Estimate*.

**Note:** Supported format for **Date** type fields, such as **Due Date** is ‘YYYY-MM-DD’.

### 22.7.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                        |
|-----|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                 |
|     | Connection:                     |                                                                                                                                                                                                                                                                                    |
| 2   | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxx.atlassian.net/). |
| 3   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and create issue. This field is mandatory.                                                                                                                                                                |
|     | Password:                       |                                                                                                                                                                                                                                                                                    |
| 4   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                          |

|   |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | Password /API Key | <p>Password can be entered as Text (for static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p>Provide an API Key in case of on cloud instance.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 6 | Test Connection   | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Input Tab:      |                              |                                                                                                                                                                                                                                                                                                                                                                                                               |

| 1               | Accept Update fields as JSON | Enable checkbox to accept the fields to be updated in JSON format.                                                                                                                                                                                                                                                                                                                                            |
| 2               | Update fields JSON           | <p>Select the field in the stream containing the JSON text.<br/>Sample JSON is shown below.<br/><code>{"Summary": "summaryfromAE", "Project": "SP", "Priority": "Medium", "description": "Dec from AE", "Issue Type": "Bug"}</code></p> <p>The JSON field can be any field in the stream or can be created using any step such as Generate Rows, Modified Java Script, Set field value to a constant etc.</p> |
| Tabular Fields: |                              |                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3               | Variable Field Name          | This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.                                                                                                                                                                                                                                                                                   |
| 4               | Static Field Name            | Clicking on this column field brings a dialog with the list of available fields to create an issue.                                                                                                                                                                                                                                                                                                           |

|   |             |                                                                                                                                                                                                                                                                                                                           |
|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | Field Value | <p>Specify a Field value to hold the value of field name selected in Field Name column above.</p> <p>All the mandatory fields for creating an issue for a particular instance must be selected and the field values should be provided else the workflows throw error mentioning the mandatory field that is missing.</p> |
|---|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

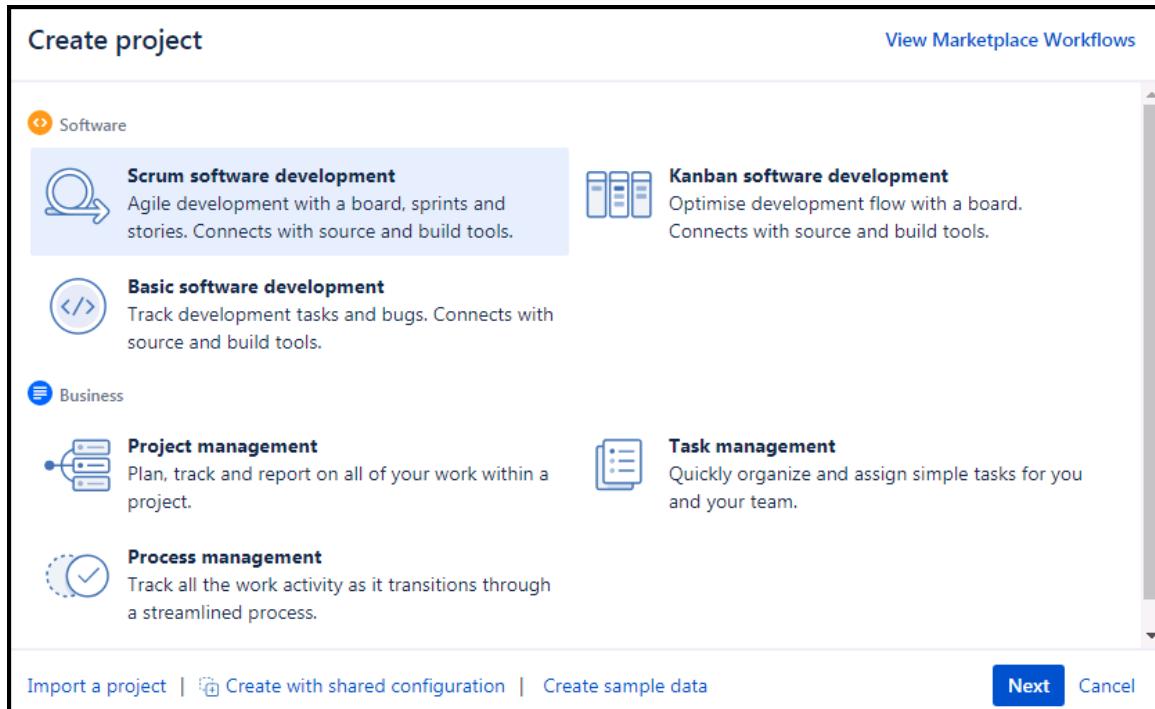

| Output Tab: |                |                                                                                                                                                                                                                                                             |
|-------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.         | Field Name     | Description                                                                                                                                                                                                                                                 |
|             | Output Fields: |                                                                                                                                                                                                                                                             |
| 1           | ID             | Output field to hold the ID of the issue created on successful plugin execution. The mandatory fields depend on the particular instance configurations.                                                                                                     |
| 2           | Key            | <p>Output field to hold the key of the issue created on successful plugin execution</p> <p>Errors can be captured in the step error handling (right-click step and select error handling) to make the error message visible on AutomationEdge Requests.</p> |

## 22.8 Jira: Create Project

### 22.8.1 Description

Jira Create Project plugin step is designed to create a software or business project in an instance of JIRA software.

The project types seen in the screenshot below can also be chosen in the plugin options as described in the Input Tab table below.

**Prerequisites:**

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

**22.8.2 Configurations**

| No. | Field Name                      | Description                                                                                                                                                                               |
|-----|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                        |
|     | Connection:                     |                                                                                                                                                                                           |
| 2   | Server Name                     | The JIRA instance name/IP/hostname should be provided.                                                                                                                                    |
| 3   | Port                            | The port number of the JIRA instance should be provided.                                                                                                                                  |
| 4   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and create project. This field is mandatory.                                                                     |
|     | Password:                       |                                                                                                                                                                                           |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box. |
| 6   | Password/API                    | Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance                                                                  |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | <p>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 7 | Test Connection | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                 |

| No.        | Field Name           | Description                                                                                                                                                                                                                                                                                                            |
|            | Input Fields:        |                                                                                                                                                                                                                                                                                                                        |
| 1          | Project Key          | Provide a project key for the new project.                                                                                                                                                                                                                                                                             |
| 2          | Project name         | Provide the name of the new project to be created.                                                                                                                                                                                                                                                                     |
| 3          | Project type         | Provide a project type. The list of project types can be populated using the Get button described below.                                                                                                                                                                                                               |
| 4          | Button: Get          | Clicking on this button brings up a list of project types (viz. software, ops, service_desk, business).                                                                                                                                                                                                                |
| 5          | Project Template Key | Select a valid project Template Key based on the type of project selected. The list of Project Template Keys can be populated using the Get button described below.                                                                                                                                                    |
| 6          | Button: Get          | <p>Clicking on this button brings up a list of project Template Keys as below,</p> <ul style="list-style-type: none"> <li>• com.pyxis.greenhopper.jira:gh-scrum-template</li> <li>• com.pyxis.greenhopper.jira:gh-kanban-template</li> <li>• com.pyxis.greenhopper.jira:basic-software-development-template</li> </ul> |

|    |                                   |                                                                                                                                                                                                                                                                                             |
|----|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                                   | <ul style="list-style-type: none"> <li>• com.atlassian.jira-core-project-templates:jira-core-project-management</li> <li>• com.atlassian.jira-core-project-templates:jira-core-task-management</li> <li>• com.atlassian.jira-core-project-templates:jira-core-process-management</li> </ul> |
| 7  | Project description               | Provide the description of the new project to be created                                                                                                                                                                                                                                    |
| 8  | Project lead(Username/Account ID) | Mention the Username(/Account ID) who will be set as the lead for the new project.(This will accept only valid users on JIRA)                                                                                                                                                               |
| 9  | Button: Get Username              | Clicking on this button brings up the list of JIRA usernames.                                                                                                                                                                                                                               |
| 10 | URL                               | Provide a URL for online help                                                                                                                                                                                                                                                               |

## 22.9 Jira: Delete Issue

Jira Delete Issue Plugin step deletes an issue in an instance of JIRA software.

### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.9.1 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                         |
|-----|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                  |
|     | Connection:                     |                                                                                                                                                                                                                                                                                     |
| 2   | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/). |
| 3   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and delete project. This field is mandatory.                                                                                                                                                               |
|     | Password:                       |                                                                                                                                                                                                                                                                                     |
| 4   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                           |
| 5   | Password/API                    | Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance                                                                                                                                                            |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 22.10 Jira: Delete User

### 22.10.1 Description

Jira Delete User Plugin step is designed to delete a user in an instance of JIRA software.

#### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.10.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## 22.11 Jira: Delete Project

### 22.11.1 Description

Jira Delete Project Plugin step deletes a JIRA project in an instance of JIRA software.

#### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.11.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                       |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                          |
| 2   | Server Name                     | The JIRA instance name/IP/hostname should be provided.                                                                                                                                                                                                                                                                                   |
| 3   | Port                            | The port number of the JIRA instance should be provided.                                                                                                                                                                                                                                                                                 |
| 4   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and delete project. This field is mandatory.                                                                                                                                                                                                                    |
|     | Password:                       |                                                                                                                                                                                                                                                                                                                                          |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                |
| 6   | Password/API                    | <p>Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance</p> <p>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 1          | Project Key/Id | Provide Project key or id of the project to be deleted. |

## 22.12 Jira: Download Attachments

### 22.12.1 Description

This plugin step downloads all the attachments associated with a JIRA issue in an on premise or on-cloud version of JIRA instance.

**Prerequisites:**

- JIRA instance (JIRA-8.0.2 (On-Premise) and JIRA (On-Cloud)) and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.12.2 Configurations

| No. | Field Name  | Description                                                                                                |
|-----|-------------|------------------------------------------------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow.                                         |
|     | Connection: |                                                                                                            |
| 1   | Base URL    | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                 | xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxx.atlassian.net/).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2 | Username                        | A username with appropriate permissions to authenticate to JIRA instance and attach file to an issue. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3 | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5 | Password/API Key                | <p>Password can be entered as Text (for static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p>Provide an API Key in case of on cloud instance.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 6 | Test Connection                 | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Input Tab: |               |                                                                                                                                                                                    |

| No.        | Field Name    | Description                                                                                                                                                                        |
|            | Input Fields: |                                                                                                                                                                                    |
| 1          | Issue Key     | <p>Issue Key of the issue to be deleted.</p> <p><b>Note:</b><br/>REST API can get maximum of 1000 and 100 issues for on-premise and on-cloud instance respectively. This is an</p> |

|   |                                       |                                                                                                                                                                          |
|---|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                       | intentional limitation on JIRA applications to avoid performance-related issues such as an OutOfMemoryException.                                                         |
| 2 | Button: Get                           | Clicking on this button brings up the issue keys available as per the access permission of Username provided in Connection.                                              |
| 3 | Output Folder Path                    | File path of the file to be attached to the issue.                                                                                                                       |
| 4 | Button: Browse Folder                 | Clicking on this button brings up the dialog to browse the path of an output folder to download attachments for the issue key specified.                                 |
| 5 | Delete Output Folder Contents before  | Mouse hover to see the allowed values “Yes”, “No”. Type Yes to delete output folder contents before downloading new files, otherwise type No                             |
| 6 | Add DateTimeStamp for Duplicate Files | Mouse hover on this field to see that the allowed values are “Yes” or “No”. Type Yes to Download files and add DateTimeStamp. This is useful in case of duplicate files. |
| 7 | Add File to Result                    | Allowed values: ‘Yes’ or ‘No’<br>Provide ‘Yes’ if you wish to provide a link to download the attachment on AutomationEdge else provide ‘No’.                             |

**Output Tab:**

| No. | Field Name        | Description                                                                                                                                                                                                                                 |
|-----|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Output Fields:    |                                                                                                                                                                                                                                             |
| 1   | Total Files       | Specify a field name to hold the total files upon successful plugin execution. Default field name is “Total Files”. This field is mandatory.                                                                                                |
| 2   | Downloaded Files  | Specify a field name to hold the number of the Downloaded Files.                                                                                                                                                                            |
| 3   | Overwritten Files | Specify a field name to hold the total number of the Overwritten Files.<br><br>Errors can be captured in the step error handling (right-click step and select error handling) to make the error message visible on AutomationEdge Requests. |

## 22.13 Jira: Get Issue

### 22.13.1 Description

Jira Get Issue Plugin step gets an issue from an instance of JIRA software.

#### Prerequisites:

© 2023 AutomationEdge Inc All Rights Reserved.  
This document is for your company’s internal use only and may not be distributed to any third party.

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.13.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 2   | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 3   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and get issue. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|     | Password/AP Key:                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 4   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 5   | Password/API Key                | Provide Password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance<br><br>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br><br><b>Note:</b><br>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a> |
| 6   | Test Connection                 | Verifies whether the connection is established or not.<br><br><b>Note:</b><br>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Input Tab: |               |                                                                                                                                                                                                                                                                                                                                                                                                                       |

|   | Table Fields: |                                                                                                                                                                                                                                                                                              |
| 3 | Field Name    | On the click of this cell, field explorer appears with Issue Field Names (Display names). Select the fields whose values are to be fetched.                                                                                                                                                  |
| 4 | Output Field  | Specify an output field to hold the field values.                                                                                                                                                                                                                                            |

## 22.14 Jira: Get Transition

### 22.14.1 Description

This plugin gets a list of the transitions possible for a provided issue (issue key) in an on-premise or on-cloud version of JIRA instance.

**Prerequisites:**

- JIRA instance (JIRA-8.0.2 (On-Premise) and JIRA (On-Cloud)) and access details
- json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.14.2 Configurations

| No. | Field Name  | Description                                                                                                                                                                                                                                                                         |
|-----|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                  |
|     | Connection: |                                                                                                                                                                                                                                                                                     |
| 1   | Base URL    | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/). |
| 2   | Username    | A username with appropriate permissions to authenticate to JIRA instance and get Transitions. This field is mandatory.                                                                                                                                                              |
|     | Password:   |                                                                                                                                                                                                                                                                                     |

|   |                  |                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|---|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Password/API Key | <p>Password can be entered as Text (for static value or environment variable). This field is mandatory.</p> <p>Provide an API Key in case of on cloud instance.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 4 | Test Connection  | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                               |

| Input Tab: |               |                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 22.15 Jira: Link Issues

### 22.15.1 Description

Jira Link Issues Plugin step creates a link between two issues in an instance of JIRA software.

#### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.15.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                       |
|-----|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                   |
| 2   | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxx.atlassian.net/).                                                |
| 3   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and get issue. This field is mandatory.                                                                                                                                                                                                                  |
| 4   | Password:                       |                                                                                                                                                                                                                                                                                                                                   |
|     | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                         |
| 5   | Password/API                    | Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance<br><br>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | <p>If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 6 | Test Connection | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                        |

| Input Tab: |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name      | Description                                                                                                                                                                                                                                                                                                                                                                                                                             |
|            | Input Fields:   |                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 1          | Issue Key       | <p>The Key of the inward issue for which link is to be created. The issue key can be chosen from a pop-up obtained by clicking the Get button next to it as described below.</p> <p><b>Note:</b><br/>REST API returns maximum of 1000 and 100 issues for on-premise and on-cloud instance respectively. This is an intentional limitation on JIRA applications to avoid performance-related issues such as an OutOfMemoryException.</p> |
| 2          | Get             | <p>Clicking on this button brings up the issue keys available as per the access permission of Username provided in Connection.</p>                                                                                                                                                                                                                                                                                                      |
| 3          | Issue Link Type | <p>Type of the link to be created between the two issues. Following are the issue link types,</p> <ul style="list-style-type: none"> <li>• is duplicated by</li> <li>• duplicates</li> <li>• clones</li> <li>• relates to</li> <li>• blocks</li> <li>• is cloned by</li> <li>• is blocked by</li> </ul> <p>The issue link type can be chosen from a pop-up obtained by clicking the Get button next to it as described below.</p>       |

|   |                        |                                                                                                                             |
|---|------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| 4 | Get                    | Clicking on this button brings up the available Issue Link Types.                                                           |
| 5 | Issue Key to be linked | The Key of the outward issue with which the link is to be created.                                                          |
| 6 | Get                    | Clicking on this button brings up the issue keys available as per the access permission of Username provided in Connection. |

## 22.16 Jira: Perform Transition

### 22.16.1 Description

JIRA perform transition plugin step performs a transition of an issue in a JIRA instance.

#### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.16.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                   |
|-----|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                            |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                               |
| 1   | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxx.atlassian.net/).                                                                                                            |
| 4   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and perform a transition. This field is mandatory.                                                                                                                                                                                                                                                                   |
|     | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                               |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                     |
| 6   | Password/API Key                | Password can be entered as Text (for static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |

|   |                 |                                                                                                                                                                                                                                                                                                                       |
|---|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | <p>Provide an API Key in case of on cloud instance.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 7 | Test Connection | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>               |

| Input Tab: |                    |                                                                                                                                                                                                                                                                                                                                     |
|------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name         | Description                                                                                                                                                                                                                                                                                                                         |
|            | Input Fields:      |                                                                                                                                                                                                                                                                                                                                     |
| 1          | Issue Key          | <p>Specify the Key of the issue on which transition is to be performed.</p> <p><b>Note:</b><br/>REST API can get maximum of 1000 and 100 issues for on-premise and on-cloud instances respectively. This is an intentional limitation on JIRA applications to avoid performance-related issues such as an OutOfMemoryException.</p> |
| 2          | Button: Get        | Click this button to get all Issue Keys available in the JIRA instance as per the access permission of Username provided in Connection.                                                                                                                                                                                             |
| 3          | Transition Name/ID | Specify the Name or ID of the transition to be performed. You may get the Name of the transition by clicking the Get button as described below.                                                                                                                                                                                     |
| 4          | Button: Get        | Clicking on this button brings a dialog for all the Transitions Names possible for the provided issue.                                                                                                                                                                                                                              |

**Note:** Errors can be captured in the step error handling (right-click step and select error handling) to make the error message visible on AutomationEdge Requests.

## 22.17 Jira: Remove Label

Jira Remove Label Plugin step removes a label value in an instance of JIRA software.

**Prerequisites:**

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

**22.17.1 Configurations**

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| 3          | Label         | Specify a label value to be removed from an issue.                                                                          |

## 22.18 Jira: Remove Group

### 22.18.1 Description

Jira Remove Group Plugin step removes a specified group in an instance of JIRA software.

#### Prerequisites:

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### 22.18.2 Configurations

| No. | Field Name  | Description                                                                                                                                                                                                                                                                         |
|-----|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                  |
|     | Connection: |                                                                                                                                                                                                                                                                                     |
| 2   | Base URL    | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/). |
| 3   | Username    | A username with appropriate permissions to authenticate to JIRA instance and remove a user from a group. This field is mandatory.                                                                                                                                                   |
|     | Password:   |                                                                                                                                                                                                                                                                                     |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 5 | Password/API Key                | <p>Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance</p> <p>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 6 | Test Connection                 | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Input Tab: |               |                                                                                                                                                 |

| 1          | Group Name    | Name of the group to be removed. The data type is String. This field is mandatory.                                                              |
| 2          | Button: Get   | <p>Clicking on this button brings up the list of groups.</p> <p><b>Note:</b><br/>Groups displayed on Get button is set to max limit of 100.</p> |

## 22.19 Jira: Remove User from Group

Jira Remove User from Group Plugin Step removes a specified user from a group on on-premise or on-cloud versions of a JIRA software instance.

**Prerequisites:**

- JIRA instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

**22.19.1 Configurations**

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 2   | Server Name                     | The JIRA instance name/IP/hostname should be provided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3   | Port                            | The port number of the JIRA instance should be provided.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 4   | Username                        | A username with appropriate permissions to authenticate to JIRA instance and remove a user from a group. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 6   | Password/API                    | <p>Provide password of the username to authenticate in case of on premise instance and API Key in case of on cloud instance</p> <p>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 7   | Test Connection                 | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|  |  |                                                                                                                                                                                                                   |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Input Tab: |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| No.        | Field Name           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | Input Fields:        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1          | Username/Account ID  | Username/key of the user to be removed from a specific group. The Username in case of server instance and Account ID in case of a cloud instance. The data type is string. This field is mandatory.<br><br><b>Note:</b><br>Account ID can be found in the URL of the cloud instance when you open user profile. E.g.<br><a href="https://admin.atlassian.com/68f0ebf6b0dded/users/5e4d195e9706">https://admin.atlassian.com/68f0ebf6b0dded/users/5e4d195e9706</a> |
| 2          | Button: Get Username | Clicking on this button brings up the list of the usernames as per the access permissions of Username provided in Connection.                                                                                                                                                                                                                                                                                                                                     |
| 3          | Group Name           | Specify the group name from which the user is to be removed.<br><br><b>Note:</b><br>Groups displayed on the Get button are set to a max limit of 100.                                                                                                                                                                                                                                                                                                             |
| 4          | Button: Get          | Clicking on this button brings up a list of the groups as per the access permissions of the Username provided in Connection.                                                                                                                                                                                                                                                                                                                                      |

## 22.20 Jira: Update Issue

This plugin step updates a JIRA issue on on-premise or on-cloud versions of a JIRA instance.

### Limitations:

The following fields are unsupported: *Time Tracking*, *Original Estimate*, and *Remaining Estimate*.

**Note:** Supported format for **Date** type fields, such as **Due Date** is 'YYYY-MM-DD'.

### 22.20.1 Configurations

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2 | Base URL                        | For on-premise JIRA instance specify IP/Fully Qualified Domain Name/Hostname:Port of the JIRA Server (e.g. xxx.xxx.xxx.xxx:Port). Port can be optional as per network configuration.<br>In case of Cloud instance specify the JIRA instance URL (e.g. https://xxxx.atlassian.net/).                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3 | Username                        | A username with appropriate permissions to authenticate to JIRA instance and update issue. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|   | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5 | Password/API Key                | <p>Password can be entered as Text (for static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p>Provide an API Key in case of on cloud instance.</p> <p><b>Note:</b><br/>Following is the link to find the steps to generate token for on-cloud JIRA instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> |
| 6 | Test Connection                 | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b><br/>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |

Input Tab:

| No. | Field Name    | Description                                                         |
|-----|---------------|---------------------------------------------------------------------|
|     | Input Fields: |                                                                     |
| 1   | Issue Key     | The key of an issue that is to be updated. This field is mandatory. |

|   |                              |                                                                                                                                                                                                                                                                                                                                                                                 |
|---|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Button: Get                  | Clicking on this button brings up the issue keys available as per the access permission of Username provided in Connection.                                                                                                                                                                                                                                                     |
| 3 | Accept Update fields as JSON | Enable checkbox to accept the fields to be updated in JSON format.                                                                                                                                                                                                                                                                                                              |
| 4 | Update fields JSON           | Select the field in the stream containing the JSON text. Sample JSON is shown below:<br><pre>{"Summary":"summaryfromAE","Project":"SP","Priority":"Medium","description":"Dec from AE","Issue Type":"Bug"}</pre> The JSON field can be any field in the stream or can be created using any step such as Generate Rows, Modified Java Script, Set field value to a constant etc. |
|   | Tabular Fields:              |                                                                                                                                                                                                                                                                                                                                                                                 |
| 5 | Variable Field Name          | This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.                                                                                                                                                                                                                                                     |
| 6 | Field Name                   | Clicking on this column field brings a dialog with the list of available fields that can be updated in the issue and as per the access permission of Username provided in Connection.                                                                                                                                                                                           |
| 7 | Field Value                  | Provide an updated value for the field name selected in <b>Field Name</b> column above.                                                                                                                                                                                                                                                                                         |

## 23 Jira Service Desk

### 23.1 Jira Service Desk: Create Customer Request

Jira Service Desk: Create Service Request plugin step creates a service request in Jira Service Desk.

#### Compatibility:

Jira Service Desk on Cloud and Jira v8.4.1 (JIRA Service Desk Application v4.4.1) on-premise

#### Prerequisites:

- JIRA Service Desk instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

#### Limitations:

The following fields are unsupported: *Time Tracking*, *Original Estimate*, and *Remaining Estimate*.

#### Note:

Supported format for **Date** type fields, such as **Due Date** is 'YYYY-MM-DD'.

### 23.1.1 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2   | Base URL                        | <p>Server name or IP address with port of the JIRA Service Desk instance in case of on-premise (<a href="http://xx.xx.xx.xxx:8081">http://xx.xx.xx.xxx:8081</a>). In case the on-premise instance has been customized provide the appropriate URL.</p> <p>Provide cloud URL in case of on-cloud instance (e.g.- <a href="https://xxxx.atlassian.net/secure/BrowseProjects.jspa">https://xxxx.atlassian.net/secure/BrowseProjects.jspa</a>)</p>                                                                                                                                                                                                                                                                                                                                                                         |
| 4   | Username                        | Specify a username to authenticate in a JIRA Service Desk instance having the permission to create a service request. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|     | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6   | Password/API Key                | <p>Provide password of the username to authenticate in case of on premise instance and API Key/token in case of on cloud instance.</p> <p>Following is the link to find the steps to generate the API token for cloud instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> <p>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |
| 7   | Test Connection                 | <p>Click Test Connection button to Verify whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of Test Connection fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|  |                                                                                                                                                                                                                                                                                                     |
|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p>Once connection is established all requisite forms and fields in Input and Output fields are populated with the corresponding values from the Service Now instance.</p> <p>Once input and output field values are populated the connection fields may be replaced with previous step fields.</p> |

| No.        | Field Name                 | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|            | Input Fields:              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 1          | Service Desk (Project Key) | Specify the key of the JIRA Service Desk Project for which a service request is to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2          | Button: Get                | Clicking on this button populates the list of all the available JIRA Service Desk Projects in the provided JIRA Service Desk instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3          | Request Type               | Specify a Request type with which the service request is to be created.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 4          | Button: Get                | Clicking on this button populates the list of all the available Request Types in the provided JIRA Service Desk instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 5          | Accept fields as JSON      | Enable checkbox to accept the fields to be updated in JSON format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 6          | JSON                       | <p>Select the field in the stream containing the JSON text. The JSON field can be any field in the stream or can be created using any step such as Generate Rows, Modified Java Script, Set field value to a constant etc.</p> <p>Sample JSON (for Request Type: Request New Software ) is shown below:<br/>                     {"Why do you need this?":"Laptop hangs","Summarize the request":"Laptop Slow","Attachment":""}</p> <p><b>Note:</b> Provide Key:Value pair for all the mandatory fields. Only String and Number fields are allowed; other data types are not supported in the current release. You may upload attachments using “JIRA Attach File to Issue” step or download attachments using “JIRA Download Attachments” step.</p> |
|            | Table:                     | Choose fields and provide field values to create a Jira issue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7          | Variable Field Name        | This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|   |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8 | Static Field Name | Clicking on this column field brings a dialog with the list of available fields to create a Service Request.                                                                                                                                                                                                                                                                                                                                                                            |
| 9 | Field Value       | <p>Specify a Field value to hold the value of field name selected in Field Name column above.</p> <p>All the mandatory fields for creating a Service Request for a JIRA Service Desk instance must be selected and the field values should be provided else the workflow throws an error mentioning the mandatory field that is missing.</p> <p>Request Type and Summary are mandatory fields for all Service Requests. Some Service Requests may have additional mandatory fields.</p> |

| Output Tab: |                |                                                                                                               |
|-------------|----------------|---------------------------------------------------------------------------------------------------------------|
| No.         | Field Name     | Description                                                                                                   |
|             | Output Fields: |                                                                                                               |
| 1           | Issue ID       | Specify an output field to hold the Issue ID of the Service Request created upon successful plugin execution. |
| 2           | Issue Key      | Specify an output field to hold the Issue key of the Service Request created on successful plugin execution.  |

## 23.2 Jira Service Desk: Update Customer Request

Jira Service Desk: Create Service Request plugin step creates a service request in Jira Service Desk.

### Compatibility:

Jira Service Desk on Cloud and Jira v8.4.1 (JIRA Service Desk Application v4.4.1) on-premise

### Prerequisites:

- JIRA Service Desk instance and access details
- **json-20180130.jar** must be present in lib folder of Process Studio as well as AE.

### Limitations:

The following fields are unsupported: *Time Tracking*, *Original Estimate*, and *Remaining Estimate*.

### Note:

Supported format for **Date** type fields, such as **Due Date** is 'YYYY-MM-DD'.

### 23.2.1 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2   | Base URL                        | <p>Server name or IP address with port of the JIRA Service Desk instance in case of on-premise (<a href="http://xx.xx.xx.xxx:8081">http://xx.xx.xx.xxx:8081</a>). In case the on-premise instance has been customized provide the appropriate URL.</p> <p>Provide cloud URL in case of on-cloud instance (e.g.- <a href="https://xxxx.atlassian.net/secure/BrowseProjects.jspa">https://xxxx.atlassian.net/secure/BrowseProjects.jspa</a>)</p>                                                                                                                                                                                                                                                                                                                                                                         |
| 4   | Username                        | Specify a username to authenticate in a JIRA Service Desk instance having the permission to create a service request. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|     | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6   | Password/API Key                | <p>Provide password of the username to authenticate in case of on premise instance and API Key/token in case of on cloud instance.</p> <p>Following is the link to find the steps to generate the API token for cloud instance: <a href="https://confluence.atlassian.com/cloud/api-tokens-938839638.html">https://confluence.atlassian.com/cloud/api-tokens-938839638.html</a></p> <p>Password/API is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory. If checkbox above is enabled Password/API field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |
| 7   | Test Connection                 | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| 1  | Service Desk (Project Key) | Name of the Service Desk for which the service request is supposed to be updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2  | Button: Get                | Clicking on this button populates the list of all the available Service Desks in provided JIRA Service Desk instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 3  | Request Type               | Specify a Request type with which the service request is to be updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 4  | Issue Key                  | Key of the issue to be updated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 5  | Button: Get                | Clicking on this button populates the list of all the available Request Types in the provided JIRA Service Desk instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 6  | Accept fields as JSON      | Enable checkbox to accept the fields to be updated in JSON format.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 7  | JSON                       | <p>Select the field in the stream containing the JSON text. The JSON field can be any field in the stream or can be created using any step such as Generate Rows, Modified Java Script, Set field value to a constant etc.</p> <p>Sample JSON (for Request Type: Request New Software) is shown below:<br/> <pre>{ "Description": "Laptop Slow Speed", "Summary": "Slows Down", "Attachment": "" }</pre></p> <p><b>Note:</b> Provide Key: Value pair for all the mandatory fields. Only String and Number fields are allowed; other data types are not supported in the current release. You may upload attachments using “JIRA Attach File to Issue” step or download attachments using “JIRA Download Attachments” step.</p> |
|    | Table:                     | Choose fields and provide field values to create a Jira issue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 8  | Variable Field Name        | This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 9  | Static Field Name          | Clicking on this column field brings a dialog with the list of available fields to update a Service Request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 10 | Field Value                | <p>Specify a Field value to hold the value of field name selected in Field Name column above.</p> <p>All the mandatory fields for creating a Service Request for a JIRA Service Desk instance must be selected and the field values should be provided else the workflow throws an error mentioning the mandatory field that is missing.</p>                                                                                                                                                                                                                                                                                                                                                                                   |

|  |                                                                                                                                     |
|--|-------------------------------------------------------------------------------------------------------------------------------------|
|  | Request Type and Summary are mandatory fields for all Service Requests. Some Service Requests may have additional mandatory fields. |
|--|-------------------------------------------------------------------------------------------------------------------------------------|

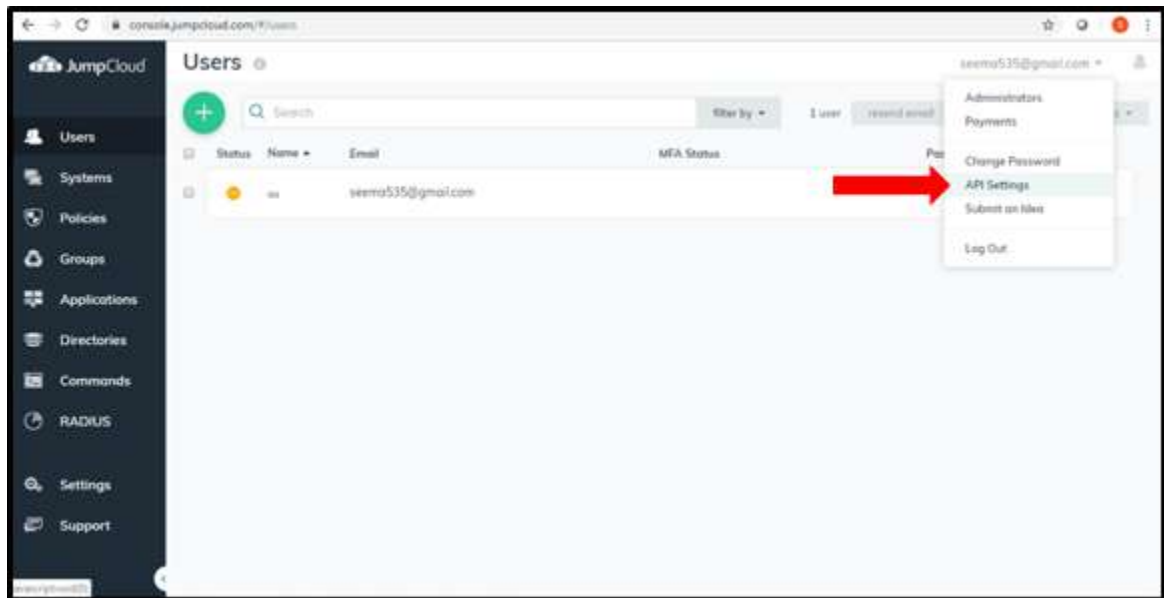

## 24 JumpCloud

JumpCloud plugin is used perform tasks in JumpCloud, which is a cloud based Directory-as-a-Service.

**JumpCloud Compatibility:** JumpCloud cloud instance

### Prerequisites

- JumpCloud instance with access details.
- JumpCloud API Key: Login to JumpCloud as an Administrator. API Key is available in API settings.

### 24.1 JumpCloud: Create System User

#### 24.1.1 Description

JumpCloud: Create System User plugin step creates a system user in JumpCloud.

#### 24.1.2 Configurations

| No. | Field Name | Description |

|---|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|   | Connection:               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2 | Base URL                  | Specify the base URL of the JumpCloud instance (e.g. <a href="https://console.jumpcloud.com">https://console.jumpcloud.com</a> ). This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                            |
|   | API Key:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3 | Accept Values from fields | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as text box.                                                                                                                                                                                                                                                                                                                                                                             |
| 4 | API Key                   | Specify an API Key created on JumpCloud instance.<br><b>Note:</b> Login as an Administrator. API Key is available in API settings.<br>This field is mandatory.<br><br>API Key is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps).<br><br>If checkbox above is enabled API Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled API Key field appears as a drop down to select fields from previous steps. |
| 5 | Test Connection           | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                                                                                                              |

| Input Tab: |                       |                                                                                                                                          |
|------------|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name            | Description                                                                                                                              |
|            | Input Fields:         |                                                                                                                                          |
| 1          | Accept Fields As JSON | Select the checkbox to use the JSON field as an input to build JSON. Else, use the Table Fields to specify the input and build the JSON. |
| 2          | JSON                  | Specify JSON in a valid format to create a system user.                                                                                  |
|            | Table Fields          | The fields will be available if the Accept Fields As JSON checkbox is not selected.                                                      |
| 3          | Variable Field Name   | Specify the field name as a field or variable.                                                                                           |
| 4          | Static Field Name     | Click to populate associated fields with details.                                                                                        |
| 5          | Field Value           | Specify the valid values for the fields associated with the field name. This is a mandatory field.                                       |

| Common Buttons: |            |                                                                                                                                                                                                                                            |
|-----------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                                |
|                 | Buttons:   |                                                                                                                                                                                                                                            |
| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                              |

## 24.2 JumpCloud: Create User Group

### 24.2.1 Description

JumpCloud: Create User Group plugin step creates a User Group in JumpCloud.

### 24.2.2 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 24.4 JumpCloud: Delete User Group

### 24.4.1 Description

JumpCloud: Delete User Group plugin step deletes a User Group in JumpCloud.

### 24.4.2 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|     | Connection:               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 2   | Base URL                  | Specify the base URL of the JumpCloud instance (e.g. <a href="https://console.jumpcloud.com">https://console.jumpcloud.com</a> ). This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                            |
|     | API Key:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3   | Accept Values from fields | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                             |
| 4   | API Key                   | Specify an API Key created on JumpCloud instance.<br><b>Note:</b> Login as an Administrator. API Key is available in API settings.<br>This field is mandatory.<br><br>API Key is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps).<br><br>If checkbox above is enabled API Key field appears as Text box and accepts static values or variables. Else if checkbox above is disabled API Key field appears as a drop down to select fields from previous steps. |
| 5   | Test Connection           | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                                                                                                              |

| Input Tab: |               |                                       |
|------------|---------------|---------------------------------------|
| No.        | Field Name    | Description                           |
|            | Input Fields: |                                       |
| 1          | Group Name    | Specify the Group Name to be deleted. |
| 2          | Button: Get   | Click to get all user groups.         |

| Common Buttons: |            |             |
|-----------------|------------|-------------|
| No.             | Field Name | Description |
|                 | Buttons:   |             |

|   |        |                                                                                                                                                                                                                                                   |
|---|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | OK     | <p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p> |
| 2 | Cancel | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                                    |

## 25 Linux

Linux plugin has been tested on,

Red Hat: Red Hat Enterprise Linux Server release 7.0 (Maipo) and Ubuntu: Ubuntu 16.04

### Prerequisites:

Root user (administrator) can execute all the steps. However, for normal user consider the following,

In case of Red Hat Enterprise Linux Server release 7.0 (Maipo), when you want to run a command that requires root rights, **Linux** checks your username against the sudoers file. **Linux** is built with security in mind. The **sudoers file** is a **file Linux** Administrators use to allocate system rights to system users. This allows the administrator to control who does what. Necessary user entry is required in the 'sudoers' file and also, the 'sudoers' file must have the necessary permissions to make these changes.

However, on Debian based systems e.g. Ubuntu if your process is started by super user, we won't be able to kill that process using this plugin because Ubuntu does not allow direct access to super user processes. This is applicable to Ubuntu 16.04 mentioned above.

### 25.1 Linux: Add User

#### 25.1.1 Description

This Linux plugin step is used to create a new user in Linux operating system.

#### 25.1.2 Configurations

| No. | Field Name     | Description                                                                             |
|-----|----------------|-----------------------------------------------------------------------------------------|
| 1   | Step Name      | Name of the step. This name has to be unique in a single workflow.                      |
|     | Configuration: |                                                                                         |
| 2   | Server Name    | Server IP of the Linux/Ubuntu Machine. This field is mandatory. Drop down is available. |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Port                                      | The port number on which Machine is running. 22 is the default port. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5 | Username                                  | The username of the Linux / Ubuntu Machine (Root). Refer Prerequisites regarding user in the introduction to this plugin. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                            |
|   | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 6 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                     |
| 7 | Password                                  | <p>The Password of the Linux/ Ubuntu Machine username to authenticate into the system.</p> <p>Password is entered using a widget. The widget handles both TextVar(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |

**Input Section:**

| No. | Field Name    | Description                                                          |
|-----|---------------|----------------------------------------------------------------------|
|     | Input Fields: |                                                                      |
| 1   | New Username  | The name of the new user to be created. This field is mandatory.     |
| 2   | New Password  | The password of the new user to be created. This field is mandatory. |

**Output Section:**

| No. | Field Name     | Description                                                                                                                                  |

This document is for your company's internal use only and may not be distributed to any third party.

Linux: Delete User plugin step deletes a user in Linux operating system.

### 25.2.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|     | Configuration:                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2   | Server Name                               | Server IP of the Linux/Ubuntu Machine. This field is mandatory. Drop down is available.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 4   | Port                                      | The port number on which Machine is running. 22 is the default port. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 5   | Username                                  | The username of the Linux / Ubuntu Machine (Root). Refer Prerequisites regarding user in the introduction to this plugin. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                          |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                   |
| 7   | Password                                  | <p>The Password of the Linux/ Ubuntu Machine username to authenticate into the system.</p> <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |

#### Input Section:

| No. | Field Name                                  | Description                                                           |
|-----|---------------------------------------------|-----------------------------------------------------------------------|
|     | Input Fields:                               |                                                                       |
| 1   | Delete User Name                            | The name of the new user to be deleted. This field is mandatory.      |
| 2   | Delete user's home Directory and mail spool | The field is dropdown. User can select either <b>Yes</b> or <b>No</b> |

#### Output Section:

| No. | Field Name     | Description |
|-----|----------------|-------------|
|     | Output Fields: |             |

|   |        |                                                                                                                                              |
|---|--------|----------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Result | Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". This field is mandatory. |
|---|--------|----------------------------------------------------------------------------------------------------------------------------------------------|

## 25.3 Linux: Get Disk Utilization

### 25.3.1 Description

Linux: Get Disk Utilization plugin step gets the amount of disk space used and available on Linux file systems.

### 25.3.2 Configurations

## 25.6 Linux: Kill Process

### 25.6.1 Description

This step is used to kill a process on Linux OS based on the provided Process ID. There is an option provided for the user to forcefully kill a Process. The user has to select **Yes** or **No** from the dropdown. Forcefully kill will always work provided the user has the permission to kill the process.

### 25.6.2 Configuration

| No. | Field Name     | Description                                                                             |
|-----|----------------|-----------------------------------------------------------------------------------------|
| 1   | Step Name      | Name of the step. This name has to be unique in a single workflow.                      |
|     | Configuration: |                                                                                         |
| 2   | Server Name    | Server IP of the Linux/Ubuntu Machine. This field is mandatory. Drop down is available. |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Port                                      | The port number on which Machine is running. 22 is the default port. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 5 | Username                                  | The username of the Linux / Ubuntu Machine (Root). Refer Prerequisites regarding user in the introduction to this plugin. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                             |
|   | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 6 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                      |
| 7 | Password                                  | <p>The Password of the Linux/ Ubuntu Machine username to authenticate into the system.</p> <p>Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |

Input:

| No. | Field Name      | Description                                                                              |
|-----|-----------------|------------------------------------------------------------------------------------------|
|     | Input Fields:   |                                                                                          |
| 1   | Process ID      | Holds the Process ID of the Process that has to be deleted. This field is mandatory.     |
| 2   | Kill Forcefully | The Field is dropdown. User can select either <b>Yes</b> or <b>No</b> from the dropdown. |

Output:

| No. | Field Name     | Description                                                                                                                                  |
|-----|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|     | Output Fields: |                                                                                                                                              |
| 1   | Result         | Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". This field is mandatory. |

**NOTE:**

This Plugin kills the process running on the Linux Machine by taking the Process ID as the input. By any chance if the status of that particular process is still active after successful execution of Plugin then there might be few possibilities.

- That particular Process is under the execution of system call(). It will be terminated once it finishes its execution.
- That Process is a Zombie Process. There is no harm if it is still alive, just try killing the Parent Process, it will be automatically terminated.
- You are not the owner of that Process.

## 25.7 Linux: Start Service

### 25.7.1 Description

This plugin is designed to start Linux Service.

### 25.7.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 2   | Server Name                               | Server IP of the Linux/Ubuntu Machine. This field is mandatory. Drop down is available.                                                                                                                                                                                                                                                                                                                                          |
| 4   | Port                                      | The port number on which Machine is running. 22 is the default port. This field is mandatory.                                                                                                                                                                                                                                                                                                                                    |
| 5   | Username                                  | The username of the Linux / Ubuntu Machine (Root). Refer Prerequisites regarding user in the introduction to this plugin. This field is mandatory.                                                                                                                                                                                                                                                                               |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 6   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                        |
| 7   | Password                                  | <p>The Password of the Linux/ Ubuntu Machine username to authenticate into the system.</p> <p>Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox</p> |

|  |                                                                                               |
|--|-----------------------------------------------------------------------------------------------|
|  | above is disabled Password field appears as a drop down to select fields from previous steps. |
|--|-----------------------------------------------------------------------------------------------|

**Input:**

| No. | Field Name                    | Description                                                     |
|-----|-------------------------------|-----------------------------------------------------------------|
|     | Input Fields:                 |                                                                 |
| 1   | Service Name                  | The name of the service to be started. This field is mandatory. |
| 2   | Maximum time out (in seconds) | Execute the plugin up to given maximum time.                    |
| 3   | Check cycle time (in seconds) | Check cycle time up to given maximum time                       |

**Output:**

| No. | Field Name     | Description                                                                                                                                  |
|-----|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|     | Output Fields: |                                                                                                                                              |
| 1   | Result         | Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". This field is mandatory. |

## 25.8 Linux Stop Service

### 25.8.1 Description

This plugin is designed to stop Linux Service.

### 25.8.2 Configurations

| No. | Field Name     | Description                                                                                                                                        |
|-----|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name      | Name of the step. This name has to be unique in a single workflow.                                                                                 |
|     | Configuration: |                                                                                                                                                    |
| 2   | Server Name    | Server IP of the Linux/Ubuntu Machine. This field is mandatory. Drop down is available.                                                            |
| 4   | Port           | The port number on which Machine is running. 22 is the default port. This field is mandatory.                                                      |
| 5   | Username       | The username of the Linux / Ubuntu Machine (Root). Refer Prerequisites regarding user in the introduction to this plugin. This field is mandatory. |
|     | Password:      |                                                                                                                                                    |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                      |
| 7 | Password                                  | <p>The Password of the Linux/ Ubuntu Machine username to authenticate into the system.</p> <p>Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |

Input:

| No. | Field Name                    | Description                                                     |
|-----|-------------------------------|-----------------------------------------------------------------|
|     | Input Fields:                 |                                                                 |
| 1   | Service Name                  | The name of the service to be stopped. This field is mandatory. |
| 2   | Maximum time out (in seconds) | Execute the plugin up to given maximum time.                    |
| 3   | Check cycle time (in seconds) | Check cycle time up to given maximum time                       |

Output:

| No. | Field Name     | Description                                                                                                                                  |
|-----|----------------|----------------------------------------------------------------------------------------------------------------------------------------------|
|     | Output Fields: |                                                                                                                                              |
| 1   | Result         | Output field to hold the result of the successful plugin execution. Default label value for this field is "Result". This field is mandatory. |

## 25.9 Linux Restart Service

### 25.9.1 Description

This plugin is designed to restart Linux Service.

| 4 | Max Wait For Response(sec) | Specify the of time to wait for a response. It must be a positive numeric value. The default value is 1 sec. The data type is string.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Output Tab |                     |                                                                                                                       |
|------------|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name          | Description                                                                                                           |
|            | Output Fields:      |                                                                                                                       |
| 1          | Response Field Name | Specify an output field to store the response. The default value for this field is "StdOut". The data type is string. |

## 25.11 Linux: Start Session

### 25.11.1 Description

This plugin is designed to start a Linux session.

**Note:** The step is not a row generating step hence; it must be an intermediate step in a workflow.

**Prerequisite:** Linux Instance with requisite User Access.

### 25.11.2 Configurations

| Input Tab: |            |             |
|------------|------------|-------------|
| No.        | Field Name | Description |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                        |
|   | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 1 | Server Name / IP Address        | Specify the server or IP address of the machine of which you want to get the Session to execute a command(s). The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                           |
| 2 | Server Port                     | Specify the TCP/IP port on which ssh protocol lives on the server. The default is 22. The data type is Number.<br><br>Note:<br>If the non-numeric value is provided for Server Port the default Port value 22 is considered during execution                                                                                                                                                                                                              |
| 3 | Timeout (In Seconds)            | Specify the timeout in seconds. If set to a number larger than zero you can specify a non-default connection timeout. Default Value 0 seconds. The data type is Number.                                                                                                                                                                                                                                                                                   |
| 4 | Username                        | Specify the username to log in with. The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                    |
|   | Password (Option 1):            |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 5 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                 |
| 6 | Password                        | Specify the password of the user. Password is encrypted and is not stored in the .psw workflow file.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br><br>The data type is String. Connection can be authenticated using username/Password or Private Key. Accordingly, this field can be mandatory or optional. |
|   | Key-Pair Details (Option 2):    |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 7 | Use Key                         | Specify Yes if you want to login using a private key. Allowed Values: 'Yes', 'No'. Default: No. The data type is String.                                                                                                                                                                                                                                                                                                                                  |
| 8 | Private Key                     | If Yes is specified in Use Key above, specify the Private Key. The private part of a private/public RSA key-pair (see: ssh-keygen).                                                                                                                                                                                                                                                                                                                       |

|    |                                 |                                                                                                                                                                                                                                                                                                                                  |
|----|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                                 | The data type is String. Connection can be authenticated using username/Password or Private Key. Accordingly, this field can be mandatory or optional.                                                                                                                                                                           |
| 9  | Pass Phrase                     | Specify the optional pass-phrase used when the key-pair was generated. The data type is String.                                                                                                                                                                                                                                  |
|    | Proxy Details (if required):    |                                                                                                                                                                                                                                                                                                                                  |
| 10 | Proxy Host                      | Specify the proxy server host to use (name or IP address). The data type is String.                                                                                                                                                                                                                                              |
| 11 | Proxy Port                      | Specify the proxy server port to use. The default value is 0. The data type is String.                                                                                                                                                                                                                                           |
| 12 | Proxy Username                  | Specify the proxy username. The data type is String.                                                                                                                                                                                                                                                                             |
|    | Proxy Password:                 |                                                                                                                                                                                                                                                                                                                                  |
| 13 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                        |
| 14 | Proxy Password                  | Specify the Proxy Password. Proxy Password is encrypted and is not stored in the .psw workflow file.<br><br>If checkbox above is enabled Proxy Password field appears as Text box. Else if checkbox above is disabled Proxy Password field appears as a drop down to select fields from previous steps. The data type is String. |
| 15 | Test Connection                 | Click to see if the supplied credentials are sufficient for logging into the SSH server. It shows an appropriate message dialog (Timeout, success or fail).<br><br>Note: The Test Connection button does not work for previous step fields. The button only works with static values and environment variables.                  |

| Output Tab: |               |                                                                                                                                                                                                                                                                                                                                                               |

## 25.12 Linux: Stop Session

### 25.12.1 Description

This step is designed to stop a running Linux session.

**Note:** The step is not a row generating step hence; it must be an intermediate step in a workflow.

#### Prerequisites:

Linux Instance with necessary User Access.

### 25.12.2 Configurations

| Input Tab: |               |                                                                                                                                                                                   |
|------------|---------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name    | Description                                                                                                                                                                       |
| 1          | Step Name     | Name of the step. This name has to be unique in a single workflow.                                                                                                                |
|            | Input Field:  |                                                                                                                                                                                   |
| 1          | Session Name* | <p>Provide the name of session created using the Linux: Start Session plugin step that is to be closed.</p> <p>The data type is string. This field is mandatory.</p> <p>Note:</p> |

|  |  |                                                                                                                                                                                                                                                                                                  |

## 26 Machine Learning

The following section covers four machine learning steps,

- Classification Model Builder
- Prediction
- Build Model For Intent Classification And Entity Extraction
- Intent Classification And Entity Extraction

The first two Machine Learning plugin steps namely ‘Classification Model Builder’ and ‘Prediction’ let you build a classification model and then use this model for prediction. These plugin steps solve classification type problem where value to be predicted takes a set of discrete values as opposed to continues values (when the value being predicted is a continuous variable, such problem is called as regression problem). Below are a few examples where these steps can be used,

- Predict support group based on issue description
- Predict customer churn based on past customer data
- Predict occupational class of the person being insured based on various attributes of the person
- Predict customers from your customer list which are likely to show interest in your new promotions

The last two Machine Learning plugin steps namely ‘Build Model for Intent Classification’ and ‘Intent Classification and Entity Extraction’ let you build a model for Intent Classification and Entity Extraction and then use this model for Intent Classification and Entity

Extraction. Identification of Intent and entity has a huge variety of use cases in industry wherever there is a need to understand the intention behind the utterances from users and automate certain processes.

### Prerequisites:

- **Use a system which has a minimum of 8GB RAM.**
- **AE Python setup (Python setup 3.6.1 or 3.8.10)**

**Note:** Support is available for both, Python 3.6.1 and Python 3.8.10. However, you cannot use both versions simultaneously.

For example, if you are currently using Python version 3.6.1 and want to use 3.8.10, then first close the current Process Studio instance, update the Python setup to version 3.8.10 and restart the Process Studio.

### Local AE Python setup steps:

1. Download the AutomationEdge's Python distribution from the link provided in the mail.
2. Close Process Studio instances and/or Agents where Machine Learning plugin is to be used.
3. Create a folder by the name 'python' – case sensitive i.e., all letters in small case – in your <Process Studio root> and/or <Agent root> folders\*.
4. Unzip the downloaded file in the following location:

*<Process Studio root>/python/ and/or*

*<Agent root>/python/*

5. Post completion of step three, your folder structure should now look like:

*<Process Studio root>/python/AE\_Python<Version>*

For example, D:/process-studio/python/AE\_Python3.8

*<Agent root>/python/AE\_Python<Version>*

For example, D:/ae-agent/python/AE\_Python3.8

6. Start Process Studio instances and/or Agents wherever this change has been made. If you skipped Step 2, just restart the instances.

\* <Process Studio Root> is the main Process Studio folder once you have unzipped Process Studio <by default, the folder name is process-studio> and similarly <Agent home> is main agent folder after unzipping <named ae-agent>

**If you don't have a python setup on your machine and want to install a new python using our AE\_Python.zip then either follow the above "Local AE Python setup steps" or the below steps:**

**Machine Level Python setup steps:**

- Get Python Setup zip(Python38.zip) file from AutomationEdge
- Extract Python38
- Add the following filepaths to the PATH Environment Variable as below:
  - <path\_till\_python\_directory>\Python38;<path\_till\_python\_directory>\Python38\Scripts;

**Note:** Perform Step 4 only if you are setting up Python 3.6.1, else proceed with Step 5.

- Create symbolic link for spacy en\_core\_web\_sm model:
  - Traverse to below path:  
 ..\Python38\lib\site-packages\spacy\data  
 Delete folder/directory viz., en.
  - On Command line execute the following command to create symbolic link:  
 python -m spacy link en\_core\_web\_sm en --force
- For older generation Pentium machines hardware specific Tensorflow libraries
- Microsoft Visual Studio C++ distribution specific to Windows OS
- Steps viz., Intent Entity Model Builder and Intent Entity Prediction use Tensorflow libraries. For compilation of these Tensorflow libraries, the processing machine's processor requires, AVX –Instruction Set Extension support. You may refer your Processor manual to check for AVX support. (for e.g. in case of intel processor the details can be obtained from the following URL-  
<https://ark.intel.com/content/www/us/en/ark.html#@Processors>)

## 26.1 Classification Model Builder

### 26.1.1 Description

This step lets you build a classification model based on training data. One column or attribute of your data set can typically be considered as one feature. Features should ideally be independent. Features are also referred to as dimensions. Value which you want to predict is called label. This step can be used to build the model when features are either of Number type or String type or mixed.

### 26.1.2 Configurations

| Configuration Tab |              |             |
|-------------------|--------------|-------------|
| No.               | Field Name   | Description |
|                   | Row Handling |             |

|                     |                              |                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1                   | Step name                    | Used to specify the name of the step. The step name should be unique within the workflow.                                                                                                                                                                                                                                                                                         |
| 2                   | Number of Rows to Process    | <p>Can have following two values.</p> <ul style="list-style-type: none"> <li>• All</li> <li>• Batch</li> </ul> <p>Governs if all the rows of dataset are passed in one shot or they are batched. Typically if you are building model on a very large dataset, you can use Batch row processing.</p>                                                                               |
| 3                   | Size                         | It has meaning only when Batch is selected for 'Number of Rows to Process'. If your dataset has 50,000 rows, 1,000 can be a good batch size candidate.                                                                                                                                                                                                                            |
| Data Model Location |                              |                                                                                                                                                                                                                                                                                                                                                                                   |
| 4                   | Build using AE Model Version | <p>Select the Python version you will use for building the model.</p> <p><b>Note:</b> The Python version you select must be same as the version you have saved in the python folder or added to the environment variable path.</p>                                                                                                                                                |
| 5                   | File name                    | Used to specify name and location of the file which will contain the model                                                                                                                                                                                                                                                                                                        |
| Algorithm           |                              |                                                                                                                                                                                                                                                                                                                                                                                   |
| 6                   | Algorithm                    | <p>Used to specify algorithm to be used for building the model. Step supports following algorithms</p> <ul style="list-style-type: none"> <li>• Linear SVC</li> <li>• SVC</li> <li>• Decision Tree Classifier</li> <li>• Random Forest Classifier</li> <li>• Logistic Regression</li> <li>• Multinomial NB</li> <li>• SGD Classifier</li> <li>• K Neighbors Classifier</li> </ul> |
| 7                   | Algorithm Parameters*        | Based on the algorithm selected, corresponding algorithm parameters are shown. These are described in the last table of this plugin description.                                                                                                                                                                                                                                  |

| 1      | Name            | Name of the field                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2      | Incoming Type   | Used to specify data type of the field. It can either be Number or String                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3      | Text Processing | <p>All the classification algorithms work on vectors of numbers. Fields which are of type String need to be converted internally to numeric vectors and this cell lets you specify all the Text Processing attributes on that field. This cell can be clicked only for fields with String data type. Ensuing dialog when you click on it has two tabs.</p> <ul style="list-style-type: none"> <li>• First tab lets you specify one or more text processing options. <ul style="list-style-type: none"> <li>○ Remove punctuation: removes standard punctuation marks from the text</li> <li>○ Remove Stop Words: removes stop words like ‘the’, ‘as’, ‘in’ etc.</li> <li>○ Additional Stop Words: this lets you choose a simple text file where every additional stop word is there on a separate line. These are your domain specific stop words.</li> <li>○ Lemmatization: this converts words like mice to mouse, houses to house etc.</li> <li>○ Stemming: this gets stem of the word no matter what word form is used in the text. So going, went, goes etc. would be converted to go</li> </ul> </li> <li>• Second tab lets you Test your text processing options. In the text box next to ‘Value:’ you can type any text. Clicking on ‘Test’ button will give you the text in the text box next to ‘Result:’ taking into account text processing options you have selected.</li> </ul> |

When you are processing a feature of type string, as mentioned in ‘Text Processing’ section of above table, this feature needs to be converted into numeric features. Text Vectorization Tab governs how all string features get converted into numeric features. An n-gram is a contiguous sequence of n items from a given sample of text or speech. Table below shows how internally a string gets tokenized given different values of n-gram

| No. | String                | N Gram Start/End | Tokens                                                    |
|-----|-----------------------|------------------|-----------------------------------------------------------|
| 1   | Weather today is good | 1-1              | 'Weather', 'today', 'good'                                |
| 2   | Weather today is good | 1-2              | 'Weather', 'today', 'good', 'Weather today', 'today good' |

|   |                       |     |                                                                                 |
|---|-----------------------|-----|---------------------------------------------------------------------------------|
| 3 | Weather today is good | 1-3 | 'Weather', 'today', 'good', 'Weather today', 'today good', 'Weather today good' |
| 4 | Weather today is good | 2-3 | 'Weather today', 'today good', 'Weather today good'                             |

\*is treated as stop word and not considered

| Text Vectorization Tab |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| No.                    | Field Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 1                      | N Gram start  | Should be a numeric value with minimum of 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 2                      | N Gram end    | Should be a numeric value greater than or equal to N Gram start                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3                      | Vectorization | <p>N-Gram operation tokenizes input string feature. Vectorization is the operation where these tokens are converted to numeric features which are needed by the algorithms. There are three types of vectorizers supported</p> <ul style="list-style-type: none"> <li>• Count Vectorizer: It counts the number of times a token shows up in the document and uses this value as its weight.</li> <li>• Tfidf Vectorizer: TF-IDF stands for “term frequency-inverse document frequency”, meaning the weight assigned to each token not only depends on its frequency in a document but also how recurrent that term is in the entire corpora.</li> <li>• Hashing Vectorizer: It is designed to be as memory efficient as possible. Instead of storing the tokens as strings, the vectorizer applies the <u>hashing trick</u> to encode them as numerical indexes. The downside of this method is that once vectorized, the features’ names can no longer be retrieved.</li> </ul> |

|          | <p>multiclass classification problems from ultra large data sets.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>datasets. If you have a lot of noisy observations in the data set you should decrease it. Lower the C value, better the results are for noisy data and exactly opposite in case of clean data.</p> <p><b>max_iter</b> (<i>int, default=1000</i>) is the maximum number of iterations to be run for convergence.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>2</p> | <p><b>SVC:</b></p> <p>The objective of a Linear (kernel) SVC (Support Vector Classifier) is to fit to the training data provided, returning a "best fit" hyperplane that divides, or categorizes, your training data. From there, after getting the hyperplane, you can then feed some features to your classifier to see what the "predicted" class is.</p>  <p><b>SVC Use Cases:</b></p> <ul style="list-style-type: none"> <li>• Predicting if student passes/fails based on previous exam scores</li> <li>• Used mainly with numerical data and when there is a need for high classification accuracy without compromising on efficiency.</li> </ul> | <p><b>Kernel</b> (<i>string, optional (default='rbf')</i>) Specifies the kernel type to be used in the algorithm. It must be one of 'linear', 'poly', 'rbf', 'sigmoid', 'precomputed' or a callable. If none is given, 'rbf' will be used. If a callable is given it is used to pre-compute the kernel matrix from data matrices; that matrix should be an array of shape (n_samples, n_samples).</p> <p>Currently, the plugin supports 'linear', 'poly' and 'rbf' as explained below,</p> <ol style="list-style-type: none"> <li>Linear Kernel works well only when the data is linearly separable (in any dimension of feature space). This hyperplane which is a learned model can be used for prediction.</li> <li>RBF kernel of SVM especially might do a decent job in most of the other datasets that are non-linear. RBF is widely used kernel with Non Linear datasets.</li> <li>Poly kernel is suitable if data is separable by higher order functions. Practical usage or benefits are pretty less. Hence it is not the most commonly used kernel.</li> </ol> <p><b>C</b> is the penalty parameter. It maximizes the margin while keeping the misclassification error minimum. C is 1 by default and it's a reasonable default choice. It works well for the majority of the common datasets. If you have a lot of noisy observations in the data set you should</p> |

### 26.1.3 Limitations:

User may get a value conversion error in the scenario where the count of fields in the Microsoft Excel Input step differs from those that need to be passed to the ML: Model Builder step. The error occurs because of incorrect data type conversion in the Microsoft Excel Input step.

The workaround is:

- Ensure that the Microsoft Excel Input step has the same fields as that required in the ML: Model Builder step.  
OR
- Ensure data type of all fields is String.

### Glossary:

- Loss: A measure of how far a model's **predictions** are from its **label**. Or, to phrase it more pessimistically, a measure of how bad the model is. To determine this value, a model must define a loss function. For example, linear regression models typically use **mean squared error** for a loss function, while logistic regression models use **Log Loss**.
- Penalty: A type of **regularization** that penalizes weights in proportion to the sum of the absolute values of the weights.
- Kernel: A classification algorithm that seeks to maximize the margin between **positive** and **negative classes** by mapping input data vectors to a higher dimensional space. For example, consider a classification problem in which the input dataset has a hundred features. To maximize the margin between positive and negative classes, a KSVM could internally map those features into a million-dimension space. KSVMs uses a loss function called **hinge loss**.
- Conversion: A convergence of a model's **predictions** to its **labels**.

## 26.2 Intent Entity Model Builder

### Introduction:

Identification of Intent and entity has a huge variety of use cases in industry wherever there is a need to understand the intention behind the utterances from users and automate certain processes.

Following are the terminology used in this plugin.

**Utterance:** Anything the user says. For example, if a user types “What’s the weather outside today in SanFrancisco ”, the entire sentence is the utterance.

**Intent:** An *intent* is the user’s intention. For example, if a user types “What’s the weather outside today in San Francisco”, the user’s intent is to get the weather reports. Intents are given a name, often a verb and a noun, such as “getWeather”.

**Entity:** An *entity* modifies a intent. For example, if a user types “What’s the weather outside today in San Francisco”, the entities are “today” and “San Francisco”. Entities are given a name, such as “dateTime” and “location”. Entities are sometimes referred to as *slots*.

### 26.2.1 Description

This step builds a model for Intent Classification and Entity Extraction.

### 26.2.2 Configurations

| No. | Field Name                                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 26.3 Intent Entity Prediction

### 26.3.1 Description

This step predicts Intent Classification and Entity Extraction based on the model built in 'Build Model for Intent Classification and Entity Extraction' step.

### 26.3.2 Configurations

#### Model Tab

| No. | Field Name                            | Description                                                                                                                                                                                                                   |
|-----|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step name                             | Specify the name of the step. Step names should be unique within a workflow.                                                                                                                                                  |
|     | Input Fields:                         |                                                                                                                                                                                                                               |
| 1   | Predict using AE Model Version        | Select the Python version you will use for building the model.<br><br><b>Note:</b> The Python version you select must be same as the version you have saved in the <b>python</b> folder or added to the environment variable. |
| 2   | Model Directory Name                  | Specify path of the model file built with 'Build model for Intent Classification and Entity Extraction' Step                                                                                                                  |
| 3   | Button: Browse                        | Click to browse for a Model file.                                                                                                                                                                                             |
| 4   | Input Data to Parse                   | Specify an input data (string) to be parsed for Intent Classification and Entity.                                                                                                                                             |
|     | Output Fields:                        |                                                                                                                                                                                                                               |
| 5   | Intent Field Name                     | Specify a fieldname to hold the Intent Field Name. The default value is intent.                                                                                                                                               |
| 6   | Show intent confidence?               | Enable checkbox to enable the Intent Confidence field below.                                                                                                                                                                  |
| 7   | Intent Confidence Field Name          | Specify a fieldname to hold Intent Confidence. The default value of the field name is intentConfidence.                                                                                                                       |
| 8   | Show Entities (in JSON format)?       | Enable checkbox to enable the Entities field below.                                                                                                                                                                           |
| 9   | Entities Field Name                   | Specify a fieldname to hold the Entities in JSON format. The default value of the field name is jsonEntities.                                                                                                                 |
| 10  | Show Intent Ranking (in JSON format)? | Enable checkbox to enable the Intent Ranking field below.                                                                                                                                                                     |
| 11  | Intent Ranking Field Name             | Specify a fieldname to hold the Intent Ranking in JSON format. All probable intents with confidence values (between 0 and 1), are generated in the JSON file. The default field name is jsonIntentRanking.                    |

## 26.4 Prediction

### 26.4.1 Description

Prediction step lets you predict the label based on the model built in 'Classification Model Builder' step.

### 26.4.2 Configurations

| Model Tab |                                |                                                                                                                                                                                                                                                                       |
|-----------|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.       | Field Name                     | Description                                                                                                                                                                                                                                                           |
| 1         | Predict using AE Model Version | Select the Python version you will use for building the model.<br><br><b>Note:</b> The Python version you select must be same as the version you have saved in the <b>python</b> folder or added to the environment variable.                                         |
| 2         | Model File                     | Used to specify path of the model file built with 'Classification Model Builder' Step                                                                                                                                                                                 |
| 3         | Load Model                     | Used to load the model and show all the relevant information of the model, like Algorithm, Vectorization algorithm, N Gram, Model parameters. All these values are read-only and only show you the values you had selected during 'Classification Model Builder' step |

| Field Mapping Tab |            |                                                        |
|-------------------|------------|--------------------------------------------------------|
| No.               | Field Name | Description                                            |
| 1                 | Feature    | Feature name used during model building step           |
| 2                 | Type       | Type of the feature, it can be either String or Number |

|   |                                       |                                                                                                                                                                                                                                                                                                                                  |
|---|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Field                                 | Field name you want to map to the corresponding feature. It is important you map right field to a feature.                                                                                                                                                                                                                       |
| 4 | Text Preprocessing                    | If type is String, preprocessing options to be used to process the string. This is explained in detail in 'Classification Model Builder' step.                                                                                                                                                                                   |
| 5 | Target Field                          | Used to specify field name where value of the predicted label will be put                                                                                                                                                                                                                                                        |
| 6 | Prediction Confidence                 | Used to indicate if you would also want prediction confidence. This field is clickable only when algorithm used for model building supports prediction confidence                                                                                                                                                                |
| 7 | Prediction Confidence for all classes | Used to indicate if you would also like prediction confidence for all the classes. Say possible prediction values are 'A', 'B' and 'C', clicking this field will give you prediction confidence for all these labels/classes. This field is clickable only when algorithm used for model building supports prediction confidence |

## 26.5 Regression Model Builder

### 26.5.1 Description

Regression Model Builder step builds a regression model based on training data.

### 26.5.2 Configurations

| Model Tab |                           |                                                                                                                                                                                                                                                                                                                                                 |
|-----------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.       | Field Name                | Description                                                                                                                                                                                                                                                                                                                                     |
| 1         | Step Name                 | Specify the name of the step. Step names should be unique within a workflow.                                                                                                                                                                                                                                                                    |
| 2         | Number of Rows to Process | <p>Select the number of rows that you want to process. Available options are:</p> <ul style="list-style-type: none"> <li>• All</li> <li>• Batch</li> </ul> <p>Governs if all the rows of dataset are passed in one shot or they are batched. Typically if you are building model on a very large dataset, you can use Batch row processing.</p> |

|   |                              |                                                                                                                                                                                                                                           |
|---|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Size                         | <p>Select the batch size of the dataset. If your dataset has 50,000 rows, 1,000 can be a good batch size candidate.</p> <p><b>Note:</b> You can specify a dataset, if you have selected Batch in the Number of Rows to Process field.</p> |
| 4 | Build Using AE Model Version | <p>Specify the AE model version.</p> <p>Available options are: Version 1.0 [Python 3.6] and Version 2.0 [Python 3.8]</p>                                                                                                                  |
| 5 | File name                    | <p>Specify the name of the file that contains the model.</p>                                                                                                                                                                              |
| 6 | Algorithm                    | <p>Select the algorithm to build the model. Available algorithms are:</p> <ul style="list-style-type: none"> <li>• Linear Regression</li> <li>• Random Forest Regression</li> <li>• Support Vector Regression</li> </ul>                  |
| 7 | Tuning Algorithms            | <p>Select the hyper tuning parameters.</p> <p><b>Note:</b> Grid Search is supported currently.</p>                                                                                                                                        |
| 8 | Algorithm Parameters*        | <p>Provide / select the algorithm parameters.</p> <p><b>Note:</b> The algorithm parameters available in the Alogrithm Parameters field depend on the selected algorithm. For more details, see <a href="#">Algorithms</a>.</p>            |

| Field Mapping Tab |                    |                                                                                                                                                                                                                                                                                                                                                     |
|-------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.               | Field Name         | Description                                                                                                                                                                                                                                                                                                                                         |
| 1                 | Name               | Specify the name of the input field that needs to be passed for model building purpose                                                                                                                                                                                                                                                              |
| 2                 | Incoming Type      | Specify the data type of the field. The data type can be either string or number.                                                                                                                                                                                                                                                                   |
| 3                 | Text Preprocessing | All the classification algorithms work on vectors of numbers. Fields which are of type String need to be converted internally to numeric vectors and this cell lets you specify all the Text Processing attributes on that field. This cell can be clicked only for fields with String data type. Ensuing dialog when you click on it has two tabs. |

|   |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                    | <ul style="list-style-type: none"> <li>• First tab lets you specify one or more text processing options. <ul style="list-style-type: none"> <li>○ <b>Remove punctuation:</b> removes standard punctuation marks from the text.</li> <li>○ <b>Remove Stop Words:</b> removes stop words like 'the', 'as', 'in', and so on.</li> <li>○ <b>Additional Stop Words:</b> choose a simple text file where every additional stop word is there on a separate line. These are your domain specific stop words.</li> <li>○ <b>Lemmatization:</b> Converts words, such as mice to mouse, houses to house, and so on.</li> <li>○ <b>Stemming:</b> Gets stem of the word no matter what word form is used in the text. Therefore, <i>going</i>, <i>went</i>, and <i>goes</i> is converted to <i>go</i>.</li> </ul> </li> <li>• Second tab lets you Test your text processing options. In the text box next to 'Value:' you can type any text. Clicking on 'Test' button will give you the text in the text box next to 'Result:' taking into account text processing options you have selected.</li> </ul> |

| 5 | Class/Target Field | Specify the target field for the regression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

When you are processing a feature of type string, as mentioned in 'Text Processing' section of above table, this feature needs to be converted into numeric features. Text Vectorization Tab governs how all string features get converted into numeric features. An n-gram is a contiguous © 2021 AutomationEdge Inc All Rights Reserved. This document is for your company's internal use only and may not be distributed to any third party. 240 of 565 Plugin Reference sequence of n items from a given sample of text or speech. Table below shows how internally a string gets tokenized given different values of n-gram.

| String                | N, Gram Start/End | Tokens                                                                          |
|-----------------------|-------------------|---------------------------------------------------------------------------------|
| Weather today is good | 1-1               | 'Weather', 'today', 'good'                                                      |
| Weather today is good | 1-2               | 'Weather', 'today', 'good', 'Weather today', 'today good'                       |
| Weather today is good | 1-3               | 'Weather', 'today', 'good', 'Weather today', 'today good', 'Weather today good' |

|                       |     |                                                     |
|-----------------------|-----|-----------------------------------------------------|
| Weather today is good | 2-3 | 'Weather today', 'today good', 'Weather today good' |
|-----------------------|-----|-----------------------------------------------------|

| 1                      | N Gram start  | Specify a numeric value with minimum of 1.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 2                      | N Gram start  | Specify a numeric value greater than or equal to N Gram start.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3                      | Vectorization | <ul style="list-style-type: none"> <li>• N-Gram operation tokenizes input string feature. Vectorization is the operation where these tokens are converted to numeric features which are needed by the algorithms. There are three types of vectorizers supported</li> <li>• <b>Count Vectorizer:</b> It counts the number of times a token shows up in the document and uses this value as its weight.</li> <li>• <b>Tfidf Vectorizer:</b> TF-IDF stands for “term frequency-inverse document frequency”, meaning the weight assigned to each token not only depends on its frequency in a document but also how recurrent that term is in the entire corpora.</li> <li>• <b>Hashing Vectorizer:</b> It is designed to be as memory efficient as possible. Instead of storing the tokens as strings, the vectorizer applies the hashing trick to encode them as numerical indexes. The downside of this method is that once vectorized, the features’ names can no longer be retrieved.</li> </ul> |

### 26.5.3 Limitations:

User may get a value conversion error in the scenario where the count of fields in the Microsoft Excel Input step differs from those that need to be passed to the ML: Model Builder step. The error occurs because of incorrect data type conversion in the Microsoft Excel Input step.

The workaround is:

- Ensure that the Microsoft Excel Input step has the same fields as that required in the ML: Model Builder step.  
OR
- Ensure data type of all fields is String.

## 26.6 Regression Prediction

### 26.6.1 Description

Regression Prediction step lets you predict the label based on the model built in 'Regression Model Builder' step.

### 26.6.2 Configurations

| General tab |            |                                                                                                                                                                                                                                                                                                                        |

| 3           | Load Model | Click to load the model and show all the relevant information of the model, like Algorithm, Vectorization algorithm, N Gram, Model parameters.<br><br><b>Note:</b> All the values are read-only and only show the values you had selected during 'Classification Model Builder' step.<br><br>This is a mandatory step. |

| Field Mapping tab |                    |                                                                                                                                                |
|-------------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| No.               | Field Name         | Description                                                                                                                                    |
| 1                 | Feature            | Feature name used during model building step                                                                                                   |
| 2                 | Type               | Type of the feature, it can be either String or Number                                                                                         |
| 3                 | Field              | Field name you want to map to the corresponding feature. It is important you map right field to a feature.                                     |
| 4                 | Text Preprocessing | If type is String, preprocessing options to be used to process the string. This is explained in detail in 'Classification Model Builder' step. |
| 5                 | Target Field       | Used to specify field name where value of the predicted label will be put.                                                                     |

## 26.7 Similarity Lite

Build the model based on input training data. Then by using this model, predict the answer based on input query in the specified output field.

All processes are carried in one execution.

**Note:** Use the step when data is at minimum level based on the hardware configuration of the machine under consideration.

### 26.7.1 Description

The step is used to find the most similar sentences to the input query against the input given in a single sentence, paragraph, or text.

### 26.7.2 Configurations

| General tab |                              |                                                                                             |
|-------------|------------------------------|---------------------------------------------------------------------------------------------|
| No.         | Field Name                   | Description                                                                                 |
| 1           | Step Name                    | Specify the name of the step. Step names should be unique within a workflow.                |
| 2           | Number of Rows to Process    | Specify total number of rows to be taken as input. (Default value: 500)                     |
| 3           | Build using AE Model Version | Select from the dropdown that which Python version to use for build and prediction purpose. |
| 4           | Query                        | Specify which column/features to be considered for building model.                          |

|   |               |                                                                                |
|---|---------------|--------------------------------------------------------------------------------|
| 5 | Top n results | Specify number of rows closest to the original answer to be fetched as output. |
|---|---------------|--------------------------------------------------------------------------------|

| Field Mapping tab |                    |                                                                                                                                |
|-------------------|--------------------|--------------------------------------------------------------------------------------------------------------------------------|
| No.               | Field Name         | Description                                                                                                                    |
| 1                 | Feature / Name     | Feature or name used during model building step.                                                                               |
| 2                 | Text Preprocessing | Preprocessing options to be used to process the text/string. Please refer "Classification Model Builder's" step documentation. |
| 3                 | Target Field       | Specify output field name in which prediction value will be put.                                                               |

When you are processing a feature of type string, as mentioned in 'Text Processing' section of above table, this feature needs to be converted into numeric features. Text Vectorization Tab governs how all string features get converted into numeric features. An n-gram is a contiguous sequence of n items from a given sample of text or speech. Table below shows how internally a string gets tokenized given different values of n-gram

| No. | String                | N Gram Start/End | Tokens                                                                          |
|-----|-----------------------|------------------|---------------------------------------------------------------------------------|
| 1   | Weather today is good | 1-1              | 'Weather', 'today', 'good'                                                      |
| 2   | Weather today is good | 1-2              | 'Weather', 'today', 'good', 'Weather today', 'today good'                       |
| 3   | Weather today is good | 1-3              | 'Weather', 'today', 'good', 'Weather today', 'today good', 'Weather today good' |
| 4   | Weather today is good | 2-3              | 'Weather today', 'today good', 'Weather today good'                             |

\*is treated as stop word and not considered

| Text Vectorization Tab |               |                                                                                                                             |
|------------------------|---------------|-----------------------------------------------------------------------------------------------------------------------------|
| No.                    | Field Name    | Description                                                                                                                 |
| 1                      | N Gram start  | Should be a numeric value with minimum of 1                                                                                 |
| 2                      | N Gram end    | Should be a numeric value greater than or equal to N Gram start                                                             |
| 3                      | Vectorization | N-Gram operation tokenizes input string feature. Vectorization is the operation where these tokens are converted to numeric |

|  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--|--|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | <p>features which are needed by the algorithms. There are three types of vectorizers supported</p> <ul style="list-style-type: none"> <li>• Count Vectorizer: It counts the number of times a token shows up in the document and uses this value as its weight.</li> <li>• Tfidf Vectorizer: TF-IDF stands for “term frequency-inverse document frequency”, meaning the weight assigned to each token not only depends on its frequency in a document but also how recurrent that term is in the entire corpora.</li> <li>• Hashing Vectorizer: It is designed to be as memory efficient as possible. Instead of storing the tokens as strings, the vectorizer applies the <u>hashing trick</u> to encode them as numerical indexes. The downside of this method is that once vectorized, the features’ names can no longer be retrieved.</li> </ul> |

## 27 ManageEngine SDP

ManageEngine SDP plugin steps have been designed to perform tasks in an instance of ManageEngine ServiceDesk Plus.

### Prerequisites:

- ManageEngine ServiceDesk Plus instance with access details.

### Auth Token and Refresh token:

Generate Auth Token for ON\_PREMISE ManageEngine ServiceDesk deployments and Generate, Client ID, Client Secret and Refresh token for CLOUD deployments.

- Please refer [Appendix 14: Managed Engine SDP – Generate Auth Token/Refresh Token](#) for generating the refresh token and auth token.

### References:

- Cloud API documentation and common error codes: <https://www.manageengine.com/products/service-desk/sdpod-v3-api/SDPOD-V3-API.html>
- On-premise API documentation: Login to ServiceDesk on-premise application using your admin user name and password -> click Admin -> API -> Documentation

**Table Matrix: Manage Engine SDP steps and supported modules**

## 27.1 Add Request Worklog

**Compatibility:** Add Request Worklog is compatible with ManageEngine Cloud; on Linux and Windows environments

**Limitation:**

Currently, worklog can only be created for ManageEngine SDP Cloud deployment.

**Reference:**

Cloud API documentation and common error codes:

<https://www.manageengine.com/products/service-desk/sdpod-v3-api/SDPOD-V3-API.html>

**Known issue:**

The step does not provide support input through Environment Variables.

### 27.1.1 Description

ManagedEngine SDP: Add Request Worklog step adds a worklog to an existing request in ManageEngine ServiceDesk Plus.

### 27.1.2 Configurations

| General Tab: |             |                                                                    |
|--------------|-------------|--------------------------------------------------------------------|
| No.          | Field Name  | Description                                                        |
| 1            | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|              | Connection: |                                                                    |

|   |                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Deployment Type                              | <p>Specify the Deployment type of the ManageEngine SDP instance. Select one from the dropdown i.e. either CLOUD or ON_PREMISE.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>Auth Token is displayed when Deployment Type is ON_PREMISE.</li> <li>Client ID, Client Secret and Refresh Token are displayed when Deployment Type is CLOUD.</li> </ul>                                                                                        |
| 2 | Base URL                                     | <p>Base URL of ManageEngine ServiceDesk Plus (e.g. <a href="https://sdpondemand.manageengine.com">https://sdpondemand.manageengine.com</a> for on cloud instance)</p> <p>The data type is string. This field is mandatory.</p>                                                                                                                                                                                                                               |
| 3 | Accept Values as variable/<br>static         | <p>Leave checkbox unchecked to accept Auth Token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Auth Token field to appear as Text box.</p>                                                                                                                                                                                                                                                         |
| 4 | Auth Token                                   | <p>Specify the API Key generated in ManageEngine ServiceDesk Plus instance. This field is visible when selecting the Deployment Type as "ON_PREMISE".</p> <p>If checkbox above is enabled Auth Token field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Auth Token field appears as a drop down containing values from previous steps.</p> <p>The data type is secure string. This field is mandatory.</p> |
| 5 | Accounts Server URL                          | <p>Specify the Accounts Server URL specific Data Centre of ManageEngine SDP instance (<a href="https://www.manageengine.in/products/service-desk/sdpod-v3-api/getting-started/data-centers.html">https://www.manageengine.in/products/service-desk/sdpod-v3-api/getting-started/data-centers.html</a>).</p> <p><b>Note:</b> This field is visible when the Deployment Type is "CLOUD".</p>                                                                   |

| 1         | Accept Fields as JSON | Enable checkbox to accept field names as JSON input. In the JSON text you can have dynamic fields to insert rather than static fields to be provided in the Table Fields. Leave this unchecked to provide Table Fields as input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2         | JSON                  | <p>The referenced field should have JSON text in a valid format to add a Worklog.</p> <p>About JSON text:<br/>If ‘Accept Fields as JSON’ checkbox is enabled this field is activated. Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes (“) enclosure. Provide all the required or mandatory fields as well as other fields to be inserted as keys in the JSON.</p> <p><b>Note:</b> The JSON could be from any input step such as Generate rows, Text File input, Excel Input Et al. JSON text can only be accepted from input fields from previous steps and not as files directly. JSON text can also be specified by a parameter already defined.</p> <p>The data type is string. This field is optional.</p> |

|   |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                     | <p>Sample JSON key value pairs:</p> <pre>[   {     "displayName": "Service",     "value": "HR Service Desk"   },   {     "displayName": "Title",     "value": "Test_KA10"   } ]</pre> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• The supported format to provide DateTime values is “MMM dd yyyy hh:mm a” (E.g. Apr 19 2021 10:00 am).</li> <li>• The supported format for date is “MMM dd yyyy” (e.g. Apr 19 2021).</li> <li>• JSON format for checkbox should be as “fieldName”: “[Option-1, Option-2]”.</li> <li>• For Multi-select fields provide comma separated values.</li> </ul> |
| 3 | Request ID          | ID of the Request for which worklog has to be added (One can get this ID from URL when we go to that particular request from ManageEngine SDP UI).                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4 | Button: Get         | <p>Click to get IDs of all the records of the provided form name/module name.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• The button will only work when static values or environment variables are provided for Connection details. Get button will not work if the previous step fields are provided for Connection.</li> <li>• On clicking get button, maximum 1000 worklog IDs are populated.</li> </ul>                                                                                                                                                                          |
|   | Table Fields:       | Table Fields are enabled if ‘Accept Fields as JSON’ checkbox is unchecked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| No.             | Field Name | Description                                                                                                                                                                                                                                       |
|                 | Buttons:   |                                                                                                                                                                                                                                                   |
| 1               | OK         | <p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p> |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                                     |

## 27.2 Insert Record

### 27.2.1 Description

ManagedEngine SDP: Insert Record step inserts a record in a module in ManageEngine ServiceDesk Plus.

**Compatibility:** Insert Plugin step works for on premise as well as cloud instances of Manage Engine SDP, on Linux and Windows environments.

**References:**

| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                              |

## 27.3 Update Record

### 27.3.1 Description

ManagedEngine SDP: Update Record step updates a record in a module in ManageEngine ServiceDesk Plus.

**Compatibility:** Update Plugin step is compatible with on-premise as well as cloud instances of ManageEngine SDP and works on Linux and Windows environments.

|                 | Buttons:   |                                                                                                                                                                                                                                                   |
| 1               | OK         | <p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p> |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                                     |

## 28 Microsoft Teams

### Prerequisites:

- Azure AD instance with access details.
- Provide access (whitelist) to the following URLs through your firewall and network:
  - a. <https://graph.microsoft.com>
  - b. <https://login.microsoftonline.com>

### Known Issues

Sometimes, you may see a temporary error related to the internet connectivity and network issues. The issue arises when the hostname is unresolved and the local server does not receive

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

a response from an authoritative server. For example, you may see any of the following messages:

- login.microsoftonline.com.

OR

- This is usually a temporary error during hostname resolution and means that the local server did not receive a response from an authoritative server (login.microsoftonline.com)

## 28.1 Microsoft Teams: Add Member To Channel

### 28.1.1 Description

Microsoft Teams: Add Member To Channel plugin step adds a member to the channel.

### 28.1.2 References

For user permission details, see Microsoft Teams documentation at <https://docs.microsoft.com/en-us/graph/api/channel-post-members?view=graph-rest-1.0&tabs=http>.

### 28.1.3 Permissions

Following are the required permissions:

| Permission type                    | Permission (from least to most privileged)                                                                                                                                                                                                                                        |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delegated (work or school account) | offline_access , GroupMember.Read.All, Group.Read.All, Directory.Read.All, Group.ReadWrite.All, Directory.ReadWrite.All,Channel.ReadBasic.All, ChannelSettings.Read.All, ChannelSettings.ReadWrite.All,TeamMember.Read.All, TeamMember.ReadWrite.All, ChannelMember.ReadWrite.All |

### Note

- If multiple team names with the same name are present, then provide the Team ID or unique team name.
- The operation is allowed only for channels with a membership type value of private.
- Channel name cannot end with a period (.). The following special characters are not supported: ~#%&\*{}+/\:<>?|".

### 28.1.4 Configurations

| Configuration: |             |                                                                    |
|----------------|-------------|--------------------------------------------------------------------|
| No.            | Field Name  | Description                                                        |
| 1              | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|                | Connection: |                                                                    |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                |
|---|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| 1 | Membership ID  | Provide output field name. Default value is 'MembershipID'.<br>The data type is String This field is mandatory. |

## 28.3 Microsoft Teams: Create Channel

### 28.3.1 Description

Microsoft Teams: Create Channel plugin step creates a channel in Microsoft Teams.

### 28.3.2 References

<https://docs.microsoft.com/en-us/graph/api/channel-post?view=graph-rest-1.0&tabs=http>.

### 28.3.3 Permissions

Following are the required permissions:

| Permission type                    | Permission (from least to most privileged)                                                                                                                               |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delegated (work or school account) | Channel.Create, Group.ReadWrite.All**, Directory.ReadWrite.All**, GroupMember.Read.All, Group.Read.All, Directory.Read.All, Group.ReadWrite.All, Directory.ReadWrite.All |

#### Note

- If multiple team names with the same name are present, then provide the Team ID or unique team name.
- Channel name cannot end with a period (.). The following special characters are not supported: ~#%&\*{}+/\:;<>?|'".

### 28.3.4 Configurations

| Configuration: |            |             |
|----------------|------------|-------------|
| No.            | Field Name | Description |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                |
|---|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                             |
|   | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                |
| 2 | Tenant ID                       | Select the Tenant ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 3 | Client ID                       | Select the Client ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                               |
| 5 | Client Secret                   | Specify the Client Secret of Microsoft Teams application. Client Secret is entered using a widget.<br>If the Accept Values as variable/static check box is selected, then the Client Secret field appears as text box and accepts static values or variables. Else, select Client Secret from the drop down list.<br>The field data type is String. This is a mandatory field. |
| 6 | Accept Value as variable/static | Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Refresh Token field to appear as Text box.                                                                                                                                                                               |
| 7 | Refresh Token                   | Provide the Refresh Token provided by authorization grant flow.<br>If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list.<br>The field data type is String. This is a mandatory field.                                    |
| 8 | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                       |

| Input Tab: |               |                                                                                                       |
|------------|---------------|-------------------------------------------------------------------------------------------------------|
| No.        | Field Name    | Description                                                                                           |
|            | Input Fields: |                                                                                                       |
| 1          | Team Name/ID  | Provide the Microsoft Teams team name or Team ID.<br>The data type is String This field is mandatory. |
| 2          | Get           | Click to list available teams in your user account.                                                   |

|   |                  |                                                                                                                            |
|---|------------------|----------------------------------------------------------------------------------------------------------------------------|
| 5 | New Channel Name | Provide a new channel name.<br>The data type is String This field is mandatory.                                            |
| 6 | Description      | Provide a description of the channel.                                                                                      |
| 7 | Privacy          | Specify the allowed values to act. Allowed values are 'Standard', 'Private', and 'Shared'.<br>Default value is 'Standard'. |
| 8 | Favorite         | Specify the allowed values to act. Allowed values are 'Yes' and 'No'.<br>Default value is 'No'.                            |

Output Tab:

|   | Field Name     | Description                                            |
|---|----------------|--------------------------------------------------------|
|   | Output Fields: |                                                        |
| 1 | Channel ID     | Provide output field name. The default is 'ChannelID'. |

## 28.4 Microsoft Teams: List All Teams

### 28.4.1 Description

Microsoft Teams: List All Teams plugin step lists all teams.

### 28.4.2 Known Issues

Sometimes, you may see a temporary error related to the internet connectivity and network issues. The issue arises when the hostname is unresolved and the local server does not receive a response from an authoritative server. For example, you may see any of the following messages:

- login.microsoftonline.com.

OR

- This is usually a temporary error during hostname resolution and means that the local server did not receive a response from an authoritative server (login.microsoftonline.com).

### 28.4.3 References

For user permission details, see Microsoft Teams documentation at <https://docs.microsoft.com/en-us/graph/api/group-list?view=graph-rest-1.0&tabs=http>.

### 28.4.4 Permissions

Following are the required permissions:

| Permission type | Permission (from least to most privileged) |
|-----------------|--------------------------------------------|
|-----------------|--------------------------------------------|

|                                    |                                                                                                                                             |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Delegated (work or school account) | offline_access,GroupMember.Read.All, Group.Read.All, Directory.Read.All, Group.ReadWrite.All, Directory.ReadWrite.All,Channel.ReadBasic.All |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|

**Note:**

If multiple teams have same names, then provide the Team ID or unique team name.

**28.4.5 Configurations**

| Configuration: |                                 |                                                                                                                                                                                                                                                                                                                                                                                |
|----------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                    |
| 1              | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                             |
|                | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                |
| 2              | Tenant ID                       | Select the Tenant ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 3              | Client ID                       | Select the Client ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 4              | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                                  |
| 5              | Client Secret                   | Specify the Client Secret of Microsoft Teams application. Client Secret is entered using a widget.<br>If the Accept Values as variable/static check box is selected, then the Client Secret field appears as text box and accepts static values or variables. Else, select Client Secret from the drop down list.<br>The field data type is String. This is a mandatory field. |
| 6              | Accept Value as variable/static | Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as Text box.                                                                                                                                                                                  |
| 7              | Refresh Token                   | Provide the Refresh Token provided by authorization grant flow. If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list.<br>The field data type is String. This is a mandatory field.                                       |
| 8              | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                       |

| Input Tab: |               |                                                                                                                                                                                 |
|------------|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 28.5.3 Permissions

Following are the required permissions:

| Permission type                    | Permission (from least to most privileged)                                            |
|------------------------------------|---------------------------------------------------------------------------------------|
| Delegated (work or school account) | offline_access, Team.ReadBasic.All, TeamSettings.Read.All, TeamSettings.ReadWrite.All |

### 28.5.4 Configurations

| Configuration: |             |                                                                    |
|----------------|-------------|--------------------------------------------------------------------|
| No.            | Field Name  | Description                                                        |
| 1              | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|                | Connection: |                                                                    |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                |
|---|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Tenant ID                       | Select the Tenant ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 3 | Client ID                       | Select the Client ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                               |
| 5 | Client Secret                   | Specify the Client Secret of Microsoft Teams application. Client Secret is entered using a widget.<br>If the Accept Values as variable/static check box is selected, then the Client Secret field appears as text box and accepts static values or variables. Else, select Client Secret from the drop down list.<br>The field data type is String. This is a mandatory field. |
| 6 | Accept Value as variable/static | Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Refresh Token field to appear as Text box.                                                                                                                                                                               |
| 7 | Refresh Token                   | Provide the Refresh Token provided by authorization grant flow.<br>If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list.<br>The field data type is String. This is a mandatory field.                                    |
| 8 | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                       |

| Output Tab: |                  |                                                              |
|-------------|------------------|--------------------------------------------------------------|
|             | Field Name       | Description                                                  |
|             | Output Fields:   |                                                              |
| 1           | Associated Teams | Provide output field name.<br>Default value: AssociatedTeams |

## 28.6 Microsoft Teams: List Channels

### 28.6.1 Description

Microsoft Teams: List Channels plugin step lists channels from Microsoft Teams.

| 1          | Team Name/ID  | Provide the Microsoft Teams' team name or team ID. The data type is String This field is mandatory.                                                                                                                                                                                                                                                                           |
| 2          | Get           | Click to list available channels in your user account.                                                                                                                                                                                                                                                                                                                        |
| 3          | Select        | Select query parameter to return a set of properties that are different than the default set for an individual resource or a collection of resources. With select, you can specify a subset or a superset of the default properties.<br><br>For example, when retrieving the Channels, you can specify that only the <b>ID</b> and <b>displayName</b> properties be returned. |
| 4          | Filter        | Use the filter query parameter to retrieve just a subset of a collection. For more information, click <a href="https://docs.microsoft.com/en-us/graph/query-parameters#filter-parameter">https://docs.microsoft.com/en-us/graph/query-parameters#filter-parameter</a><br>The data type is String This field is mandatory.                                                     |

| Output Tab: |                |                                                         |
|-------------|----------------|---------------------------------------------------------|
|             | Field Name     | Description                                             |
|             | Output Fields: |                                                         |
| 1           | Channels       | Provide output field name. Default value is 'Channels'. |

## 28.7 Microsoft Teams: List Channel Members

### 28.7.1 Description

Microsoft Teams: List Channel Members plugin step lists channel members from Microsoft Teams.

### 28.7.2 References

For user permission details, see Microsoft Teams documentation at <https://docs.microsoft.com/en-us/graph/api/channel-list-members?view=graph-rest-1.0&tabs=http>.

### 28.7.3 Permissions

Following are the required permissions:

| Permission type                    | Permission (from least to most privileged)                                                                                                                                                                                                                  |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delegated (work or school account) | offline_access, GroupMember.Read.All, Group.Read.All, Directory.Read.All, Group.ReadWrite.All, Directory.ReadWrite.All, Channel.ReadBasic.All, ChannelSettings.Read.All, ChannelSettings.ReadWrite.All, ChannelMember.Read.All, ChannelMember.ReadWrite.All |

#### Note

- If multiple teams have same names, then provide the Team ID or unique team name.
- Channel name cannot end with a period (.). The following special characters are not supported: ~#%& \*{}+/\:;<>?|'".

### 28.7.4 Configurations

| Configuration: |                                 |                                                                                                                                                                                                  |
|----------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                      |
| 1              | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                               |
|                | Connection:                     |                                                                                                                                                                                                  |
| 2              | Tenant ID                       | Select the Tenant ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                            |
| 3              | Client ID                       | Select the Client ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                            |
| 4              | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Client Secret field to appear as Text box. |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                |
|---|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | Client Secret                   | Specify the Client Secret of Microsoft Teams application. Client Secret is entered using a widget.<br>If the Accept Values as variable/static check box is selected, then the Client Secret field appears as text box and accepts static values or variables. Else, select Client Secret from the drop down list.<br>The field data type is String. This is a mandatory field. |
| 6 | Accept Value as variable/static | Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as Text box.                                                                                                                                                                                  |
| 7 | Refresh Token                   | Provide the Refresh Token provided by authorization grant flow. If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list.<br>The field data type is String. This is a mandatory field.                                       |
| 8 | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                       |

Input Tab:

| No. | Field Name      | Description                                                                                             |
|-----|-----------------|---------------------------------------------------------------------------------------------------------|
|     | Input Fields:   |                                                                                                         |
| 1   | Team Name/ID    | Provide the Microsoft Teams team name or team ID.<br>The data type is String This field is mandatory.   |
| 2   | Get             | Click to list available channel members in your user account.                                           |
| 3   | Channel Name/ID | Provide the channel name or ID present in the team.<br>The data type is String This field is mandatory. |
| 4   | Get             | Click to list channels present in the team in your user account.                                        |

Output Tab:

|   | Field Name      | Description                                                        |
|---|-----------------|--------------------------------------------------------------------|
|   | Output Fields:  |                                                                    |
| 1 | Channel Members | Provide output field name.<br>Default value: <i>ChannelMembers</i> |

## 28.8 Microsoft Teams: List Chats

### 28.8.1 Description

Microsoft Teams: List Chats plugin step lists chats from Microsoft Teams.

### 28.8.2 References

<https://docs.microsoft.com/en-us/graph/api/chat-list?view=graph-rest-1.0&tabs=http>

### 28.8.3 Permissions

Following are the required permissions:

| Permission type                    | Permission (from least to most privileged)                |
|------------------------------------|-----------------------------------------------------------|
| Delegated (work or school account) | offline_access, Chat.ReadBasic, Chat.Read, Chat.ReadWrite |

### 28.8.4 Configurations

Configuration:

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                    |
|-----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                             |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                |
| 2   | Tenant ID                       | Select the Tenant ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 3   | Client ID                       | Select the Client ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 4   | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                               |
| 5   | Client Secret                   | Specify the Client Secret of Microsoft Teams application. Client Secret is entered using a widget.<br>If the Accept Values as variable/static check box is selected, then the Client Secret field appears as text box and accepts static values or variables. Else, select Client Secret from the drop down list.<br>The field data type is String. This is a mandatory field. |

|             | Field Name     | Description                                                |
|             | Output Fields: |                                                            |
| 1           | Team Members   | Provide output field name. Default value is 'TeamMembers'. |

## 28.10 Microsoft Teams: Remove Member From Channel

### 28.10.1 Description

Microsoft Teams: Remove Member From Channel plugin step is used to remove a member from the channel.

#### Note

- If multiple team names with the same name are present, then provide the Team ID or unique team name.
- The operation is allowed only for channels with a membership type value of private.

- Channel name cannot end with a period (.). The following special characters are not supported: ~#%&\*{}+/\:<>?|".

### 28.10.3 Permissions

Following are the required permissions:

| Permission type                    | Permission (from least to most privileged)                                                                                                                                                                                                                                         |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Delegated (work or school account) | offline_access, GroupMember.Read.All, Group.Read.All, Directory.Read.All, Group.ReadWrite.All, Directory.ReadWrite.All, Channel.ReadBasic.All, ChannelSettings.Read.All, ChannelSettings.ReadWrite.All, TeamMember.Read.All, TeamMember.ReadWrite.All, ChannelMember.ReadWrite.All |

### 28.10.4 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                              |
| 1              | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                       |
|                | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                          |
| 2              | Tenant ID                       | Select the Tenant ID. For more details, see connection documentation. The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 3              | Client ID                       | Select the Client ID. For more details, see connection documentation. The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 4              | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                            |
| 5              | Client Secret                   | Specify the Client Secret of Microsoft Teams application. Client Secret is entered using a widget. If the Accept Values as variable/static check box is selected, then the Client Secret field appears as text box and accepts static values or variables. Else, select Client Secret from the drop down list. The field data type is String. This is a mandatory field. |
| 6              | Accept Value as variable/static | Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list.                                                                                                                                                                                                                                                |

|   |                 |                                                                                                                                                                                                                                                                                                                                          |
|---|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | Else enable checkbox for Refresh Token field to appear as Text box.                                                                                                                                                                                                                                                                      |
| 7 | Refresh Token   | Provide the Refresh Token provided by authorization grant flow. If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list.<br>The field data type is String. This is a mandatory field. |
| 8 | Test Connection | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                 |

| Input Tab: |                     |                                                                                                    |
|------------|---------------------|----------------------------------------------------------------------------------------------------|
| No.        | Field Name          | Description                                                                                        |
|            | Input Fields:       |                                                                                                    |
| 1          | Team Name/ID        | Provide the Microsoft Teams team name or Team ID. The data type is String This field is mandatory. |
| 2          | Get                 | Click to list available teams in your user account.                                                |
| 3          | Channel Name/ID     | Provide the private channel name or id present in the team.                                        |
| 4          | Get                 | Click to list private channels present in the team in your user account.                           |
| 5          | Email/Membership ID | Provide the email address or Membership ID to remove a member from the team.                       |
| 6          | Get                 | Click to list available teams in your user account.                                                |

## 28.11 Microsoft Teams: Remove Member From Team

### 28.11.1 Description

Microsoft Teams: Remove Member From Team plugin step is used to remove a member from the team.

#### Note

- If multiple team names with the same name are present, then provide the Team ID or unique team name.
- The operation is allowed only for channels with a membership type value of private.

| 1              | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                             |
|                | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                |
| 2              | Tenant ID                       | Select the Tenant ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 3              | Client ID                       | Select the Client ID.<br>For more details, see connection documentation.<br>The field data type is String. This is a mandatory field.                                                                                                                                                                                                                                          |
| 4              | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                               |
| 5              | Client Secret                   | Specify the Client Secret of Microsoft Teams application. Client Secret is entered using a widget.<br>If the Accept Values as variable/static check box is selected, then the Client Secret field appears as text box and accepts static values or variables. Else, select Client Secret from the drop down list.<br>The field data type is String. This is a mandatory field. |
| 6              | Accept Value as variable/static | Leave checkbox unchecked to accept Refresh Token from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Refresh Token field to appear as Text box.                                                                                                                                                                               |
| 7              | Refresh Token                   | Provide the Refresh Token provided by authorization grant flow.<br>If the Accept Values as variable/static check box is selected, then the Refresh Token field appears as text box and accepts static values or variables. Else, select Refresh Token from the drop down list.<br>The field data type is String. This is a mandatory field.                                    |
| 8              | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                       |

| Input Tab: |               |             |
|------------|---------------|-------------|
| No.        | Field Name    | Description |
|            | Input Fields: |             |

|   |              |                                                                                                       |
|---|--------------|-------------------------------------------------------------------------------------------------------|
| 1 | Chat Name/ID | Specify the Microsoft Teams' Chat name or Chat ID. The data type is String This field is mandatory.   |
| 2 | Get          | Click to list available chat names or chat ID.                                                        |
| 3 | Message      | Specify the message you want to send to the chat. The data type is String This field is mandatory.    |
| 4 | Importance   | Specify the allowed values to act. Allowed values: 'normal', 'high', or 'urgent'. Default is 'normal' |

| Output Tab: |                |                                                          |
|-------------|----------------|----------------------------------------------------------|
|             | Field Name     | Description                                              |
|             | Output Fields: |                                                          |
| 1           | Message ID     | Provide output field name. Default value is 'MessageID'. |

## 29 MongoDB

### Prerequisites

Valid MongoDB instance with credentials and appropriate permissions.

#### Note:

If you are using a language other than English, then apply double quotes to keys in JSON.

For Example:

```
{ "जानकारी"
:
"वांछित" }
```

### 29.1 MongoDB: Create Document

#### 29.1.1 Description

MongoDB: Create Document plugin step creates or inserts records in a specified collection.

#### 29.1.2 Configurations

| Configuration: |            |             |
|----------------|------------|-------------|
| No.            | Field Name | Description |

|   |                           |                                                                                                                                                                                                                                                                                                                       |
|---|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                    |
|   | Connection:               |                                                                                                                                                                                                                                                                                                                       |
| 2 | Deployment Type           | Deployment Type differentiates between on cloud or on premise instances. Select the type of deployment you require.<br>Available values: On-Cloud or On-Premise.<br>The data type is String. This field is mandatory.                                                                                                 |
| 3 | Host Name                 | Specify the host name based on the type of deployment you selected. Therefore, if deployment type is On-Cloud specify the cluster name and for On-Premise specify the IP address of the machine.<br><br>The data type is String. This field is mandatory.                                                             |
| 4 | Port                      | Specify the port number of the MongoDB instance.<br>The default value is 27017.<br><br><b>Note:</b> Port number is mandatory for Deployment Type: On-Premise.                                                                                                                                                         |
| 5 | Username                  | Specify a username to access the database.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                       |
|   | Password:                 |                                                                                                                                                                                                                                                                                                                       |
| 6 | Accept Values from fields | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                             |
| 7 | Password                  | Specify the password for the username.<br>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br>The data type is String. This field is mandatory. |
| 8 | Button: Test Connection   | Verifies whether the connection is available or not.<br>For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.                                                                                                                       |

| Input Tab: |               |             |
|------------|---------------|-------------|
| No.        | Field Name    | Description |
|            | Input Fields: |             |

|   |                       |                                                                                                                                                                                                                                              |
|---|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Database Name         | Select a database name to retrieve records.<br>The data type is String. This field is mandatory.                                                                                                                                             |
| 2 | Get                   | On click of this button, if connection is successfully established, it populates a list of database names on MongoDB Server.                                                                                                                 |
| 3 | Collection Name       | Select the table name to retrieve records.<br>The data type is String. This field is mandatory.                                                                                                                                              |
| 4 | Get                   | On click of this button, if connection is successfully established, it populate a list of collections for the specified database.                                                                                                            |
| 5 | Accept fields as JSON | Leave checkbox unchecked to accept JSON value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for JSON field to appear as a Text box.                                                          |
| 6 | JSON                  | Select a field name from the drop-down list or provide a variable; containing the JSON text. Provide JSON in a valid format with field records for insertion.<br>The field data type is String.<br>Sample JSON: {"name":"Ross","status":"2"} |
|   | Table Fields:         | Provide a JSON with records to insert or else select fields with corresponding values to insert in the tabular columns below.                                                                                                                |
| 7 | Field Name            | Double click to populate, fields associated with the form name.<br>The data type is string. This field is mandatory.<br><b>Note:</b> For multilevel or nested JSON, use the JSON field.                                                      |
| 8 | Field Value           | Specify valid values for the field associated with the field name.                                                                                                                                                                           |
| 9 | Field Datatype        | Specify a valid datatype from the provided list of field name and field value. Available data types: String, Int32, Int64, ObjectID, Double, Boolean, Null, Decimal128, and Date.                                                            |

Output Tab:

| No. | Field Name  | Description                                                                                                                        |
|-----|-------------|------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Document ID | Specify an output field to hold the Document ID generated as a result of successful plugin execution.<br>Default value: DocumentID |

## 29.2 MongoDB: Delete Documents

### 29.2.1 Description

MongoDB: Delete Documents plugin step deletes records for specified criteria.

### 29.2.2 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                           |
|-----|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                    |
|     | Connection:               |                                                                                                                                                                                                                                                                                                                       |
| 2   | Deployment Type           | Deployment Type differentiates between on cloud or on premise instances. Select the type of deployment you require.<br>Available values: On-Cloud or On-Premise.<br>The data type is String. This field is mandatory.                                                                                                 |
| 3   | Host Name                 | Specify the host name based on the type of deployment you selected. Therefore, if deployment type is On-Cloud specify the cluster name and for On-Premise specify the IP address of the machine.<br><br>The data type is String. This field is mandatory.                                                             |
| 4   | Port                      | Specify the port number of the MongoDB instance.<br>The default value is 27017.<br><br><b>Note:</b> Port number is mandatory for Deployment Type: On-Premise.                                                                                                                                                         |
| 5   | Username                  | Specify a username to access the database.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                       |
|     | Password:                 |                                                                                                                                                                                                                                                                                                                       |
| 6   | Accept Values from fields | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                             |
| 7   | Password                  | Specify the password for the username.<br>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br>The data type is String. This field is mandatory. |
| 8   | Button: Test Connection   | Verifies whether the connection is available or not.<br>For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.                                                                                                                       |

Input Tab:

| No. | Field Name | Description |

|-----|------------|-------------|

| Input Fields: |                 |                                                                                                                                                                                                                                                              |
|---------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1             | Database Name   | Select a database name to delete records.<br>The data type is String. This field is mandatory.                                                                                                                                                               |
| 2             | Get             | On click of this button, if connection is successfully established, it populates a list of database names on MongoDB Server.                                                                                                                                 |
| 3             | Collection Name | Select the table name to delete records.<br>The data type is String. This field is mandatory.                                                                                                                                                                |
| 4             | Get             | On click of this button, if connection is successfully established, it populate a list of collections for the specified database.                                                                                                                            |
| 5             | Criteria Query  | Specify a combination of static values or variables and the previous step.<br>The Criteria Query expression uses MongoDB's JSON-like query language with query operators to perform query operations.<br><b>Note:</b> Query must be same as MongoDB Compass. |

| Output Tab: |               |                                                                                                                               |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------|
| No.         | Field Name    | Description                                                                                                                   |
| 1           | Deleted Count | Specify an output field to hold the Deleted Count of records upon successful plugin execution.<br>Default value: DeletedCount |

## 29.3 MongoDB: Get Documents

### 29.3.1 Description

MongoDB: Get Documents plugin step gets the list of documents for the specified criteria.

## 29.4 MongoDB: Update Documents

### 29.4.1 Description

MongoDB: Update Documents plugin step updates documents with provided field name and field values on specified MongoDB instance.

**Limitation:**

The step supports only the following data types through table fields:

String, Int32, Int64, ObjectId, Double, Boolean, Date, Null, and Decimal128

**Note:**

- Field Datatype is Null and Field Value is not given by default it will take the value as "null".
- Field Datatype is String and Field Value is not given by default it will take the value as ""(empty string).

## 29.4.2 Configurations

| Configuration: |                           |                                                                                                                                                                                                                                                                                                                       |
|----------------|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                | Description                                                                                                                                                                                                                                                                                                           |
| 1              | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                    |
|                | Connection:               |                                                                                                                                                                                                                                                                                                                       |
| 2              | Deployment Type           | Deployment Type differentiates between on cloud or on premise instances. Select the type of deployment you require.<br>Available values: On-Cloud or On-Premise.<br>The data type is String. This field is mandatory.                                                                                                 |
| 3              | Host Name                 | Specify the host name based on the type of deployment you selected. Therefore, if deployment type is On-Cloud specify the cluster name and for On-Premise specify the IP address of the machine.<br><br>The data type is String. This field is mandatory.                                                             |
| 4              | Port                      | Specify the port number of the MongoDB instance.<br>The default value is 27017.<br><br><b>Note:</b> Port number is mandatory for Deployment Type: On-Premise.                                                                                                                                                         |
| 5              | Username                  | Specify a username to access the database.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                       |
|                | Password:                 |                                                                                                                                                                                                                                                                                                                       |
| 6              | Accept Values from fields | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                             |
| 7              | Password                  | Specify the password for the username.<br>If checkbox above is enabled Password field appears as Text box and accepts static values or variables. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br>The data type is String. This field is mandatory. |
| 8              | Button: Test Connection   | Verifies whether the connection is available or not.<br>For the purpose of verification fields coming from previous steps are not allowed. Static values and environment variables are allowed.                                                                                                                       |

| 2   | JSON                  | Select a field name from the drop-down list or provide a variable; containing the JSON text. Provide JSON in a valid format with field records to update. The field data type is String.<br>Sample JSON: {"name":"Ross","status":"2"} |
|     | Table Fields:         | Provide a JSON with records to update or else select fields and values to update in the tabular columns below.                                                                                                                        |
| 3   | Field Name            | Double click to populate, fields associated with the form name. The data type is string. This field is mandatory.                                                                                                                     |
| 4   | Field Value           | Specify valid values for the field associated with the field name. The data type is string.                                                                                                                                           |
| 5   | Field Datatype        | Specify a valid datatype from the provided list of field name and field value. Available data types: String, Int32, Int64, ObjectID, Double, Boolean, Null, Decimal128, and Date.                                                     |

Sample JSON with Examples:

**Sample Syntax:**

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

```
{ "field1":integerValue1,"field2":"stringValue2","field3":doubleValue3,"field4":booleanValue4,"field5":"dateValue5","field6":"nullValue6","field7":"hexadecimalValue6"}
```

**Example1:**

```
{ "MobileNumber":951234567,"FirstName":"abc","salary":3000.45,"status":true,"AddedON":"2022-04-28","AddedON":"2021-06-23T08:30:00.000+00:00","MiddleName":NULL,"ID":50d57312f08da4e79144bafb};
```

**Example2:**

```
{ "item": "journal", "qty": 25, "size": { "h": 14, "w": 21, "uom": "cm" }, "status": "A" }
```

## 30 MSSQL Server

This plugin has several steps for MSSQL Server operations.

This plugin is tested on Microsoft SQL Server 2008 R2 on Windows.

Prerequisites:

1. SQL Server instance/port number and access details.
2. SQL Server Browser windows service must be enabled on remote machine.
3. **mssql-jdbc-7.0.0.jre8.jar** must be present in the lib folder of Process Studio Distribution and AutomationEdge Agent).

Following is a description of MSSQL steps.

### 30.1 Add Data files or Log files

#### 30.1.1 Description

The plugin is designed to add Data file or Log file in MSSQL server database.

#### 30.1.2 Configurations

| No. | Field Name  | Description                                                                                                        |

|     | Connection: |                                                                                                                    |
| 2   | Server Name | The IP address of remote machine on which SQL server instance is present should be given. This field is mandatory. |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Instance Name                             | The instance name of the MSSQL server should be provided. If we provide Instance name, Port number field will get disabled. Either Port or Instance Name is mandatory.                                                                                                                                                                                                                                                                                                                                      |
| 4 | Port                                      | The port number of the MSSQL server should be provided. If we provide Port number, there is no need to provide Instance name. Port number should only be an integer. Port number field is disabled if an instance name is entered. Either Port or Instance Name is mandatory.                                                                                                                                                                                                                               |
| 5 | User Name                                 | The username of MSSQL server to authenticate.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|   | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                   |
| 7 | Password                                  | The Password to the username to authenticate. Validate username and password to authenticate to SQL server instance. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|   | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 8 | Test Connection                           | Verifies whether the connection is established or not.<br><b>NOTE:</b> Test Connection button does not work for Previous step fields. Test Connection button only works with static values and environment variables.                                                                                                                                                                                                                                                                                       |

| Input Tab: |                      |                                                                                                                                                                  |
|------------|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name           | Description                                                                                                                                                      |
|            | Input Fields:        |                                                                                                                                                                  |
| 1          | Database Name        | Name of the Database on which the datafile/log file is to be created or Select from the list populated by clicking Get Database Button. This field is mandatory. |
| 2          | Button: Get database | Populates the list of database from the connected Instance.                                                                                                      |
| 3          | Logical Name         | Logical name of the data file or log file that is to be created. This field is mandatory.                                                                        |

|    |                        |                                                                                                                                                                  |
|----|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4  | File Type              | Acceptable values are Rows Data or Log. When value is Rows Data, a datafile will be created and when value is Log, log file is created. This field is mandatory. |
| 5  | File Group             | Name of the file group for the File Type(Ex: Primary is the file group for Rows Data file type)                                                                  |
| 6  | Button: Get File Group | Populates the list of file groups from the selected database.                                                                                                    |
| 7  | Initial Size(in MB)    | Size of the file should be mentioned in MB. This field is mandatory.                                                                                             |
| 8  | Folder Path            | Specify the browsed folder path to create the file. This field is mandatory.                                                                                     |
| 9  | Button: Browse         | Browse the folder path where the file needs to be created.                                                                                                       |
| 10 | File Name              | Specify the physical name of the data file or log file. This field is mandatory.                                                                                 |

**NOTE:** Get Database, Get File Group and Browse button do not work for previous step variables. All the buttons work only with static values and environment variables.

**Autogrowth:**

| No. | Field Name                    | Description                                                                                                                                                                                                                                      |
|-----|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Autogrowth Fields:            |                                                                                                                                                                                                                                                  |
| 1   | Enable Autogrowth             | Acceptable values are “Yes” or “No”. These are visible when you hover over the field. When value is Yes, it is considered that you want to enable autogrowth for the file.<br>If No is selected any entries made in the fields below is ignored. |
|     | File Growth:                  |                                                                                                                                                                                                                                                  |
| 2   | Growth In Percent /In MB      | Acceptable values are Percent or MB. If Percent is chosen then you specify growth value in percent below. If MB is chosen you are specifying an absolute value for file growth.                                                                  |
| 3   | Value                         | Specify the value for growth of a file in percent or MB as chosen above.                                                                                                                                                                         |
|     | Maximum File Size:            |                                                                                                                                                                                                                                                  |
| 4   | Unrestricted File Growth      | Acceptable values are “Yes” or “No”. These are visible when you hover over the field. When value is Yes, it is considered that you want the Unlimited growth of the file.<br>If Yes is selected any entries in the field below are ignored.      |
| 5   | Restricted File Growth(in MB) | If Unrestricted File Growth is No, specify the Restricted size to the file in MB                                                                                                                                                                 |

**Output Tab:**

| No. | Field Name     | Description                                                                                  |
|-----|----------------|----------------------------------------------------------------------------------------------|
|     | Output Fields: |                                                                                              |
| 1   | Result         | Output field to hold the result of the successful plugin execution. This field is mandatory. |

#### Known Errors:

When you select values for Instance name or Port field from a previous step input (i.e. Generate Rows or Microsoft Excel Input etc.) the corresponding Port or Instance name is disabled but may be unlocked when revisited

## 30.2 Assign Server Roles

### 30.2.1 Description

The plugin is designed to give server related roles to the particular login user to perform server operations.

### 30.2.2 Configurations

| No. | Field Name      | Description                                                                                                                                                          |
|-----|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name       | Name of the step. This name has to be unique in a single workflow.                                                                                                   |
|     | Connection:     |                                                                                                                                                                      |
| 2   | Server name     | The IP address of remote machine on which MSSQL server instance is present should be given.                                                                          |
| 3   | Instance name   | The instance name of the MSSQL server should be provided. If we provide Instance name, Port number field will get disabled.                                          |
| 4   | Port            | The port number of the MSSQL server should be provided. If we provide Port number, there is no need to provide Instance name. Port number should only be an integer. |
| 5   | Username        | The login username of MSSQL server to authenticate.                                                                                                                  |
| 6   | Password        | The password to the login username to authenticate. The step validates username and password to authenticate to SQL server instance.                                 |
|     | Button:         |                                                                                                                                                                      |
| 7   | Test Connection | Verifies whether the connection is established or not.                                                                                                               |

|  |  |                                                                                                                                                             |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | <b>NOTE:</b> Test Connection button does not work for Previous step fields. Test Connection button only works with static values and environment variables. |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Input Tab: |                  |                                                                                                                            |

|             | Output Fields: |                                                                    |
| 1           | Result         | Output field to hold the result of the successful plugin execution |

### 30.3 Create Database

#### 30.3.1 Description

The step is used to create a database in MSSQL server.

#### 30.3.2 Configurations

| No. | Field Name    | Description                                                                                                                                     |
|-----|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name     | Name of the step. This name has to be unique in a single workflow.                                                                              |
|     | Connection:   |                                                                                                                                                 |
| 2   | Server Name   | The Hostname/Server Name/IP of the MSSQL Server. This field is mandatory. Drop down is available.                                               |
| 3   | Instance name | The instance name of MSSQL Server instance. One of the two fields Instance name or Port is mandatory. Only variables/static values are allowed. |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Port                                      | The port number of the MSSQL Server. One of the two fields Instance name or Port is mandatory. Only variables/static values are allowed.                                                                                                                                                                                                                                                                                                     |
| 5 | Username                                  | A username of the MSSQL Server. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                     |
|   | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                    |
| 7 | Password                                  | Provide the password of the username of MSSQL Server. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|   | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 8 | Test Connection                           | Verifies whether the connection is established or not.<br><b>NOTE:</b> Test Connection button does not work for previous step fields. Test Connection button only works with static values and environment variables.                                                                                                                                                                                                                        |

| Input Tab: |               |                                             |
|------------|---------------|---------------------------------------------|
| No.        | Field Name    | Description                                 |
|            | Input Fields: |                                             |
| 1          | Database Name | The name of the new database to be created. |

| Output Tab: |               |                                                                                                                                                                               |

|             | Output Field: |                                                                                                                                                                               |
| 1           | Result        | Output field to hold the result of successful plugin execution. This field is mandatory.<br>Error Handling:<br>Refer <a href="#">Appendix 1: Error Handling in IT Plugins</a> |

## 30.4 Create Login User

### 30.4.1 Description

The plugin is designed to create login user for the MSSQL Server.

This plugin is only valid for SQL Server Authentication and not Windows Authentication.

### 30.4.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                           |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2   | Server Name                               | The IP address of remote machine on which SQL server instance is present should be given.                                                                                                                                                                                                                                                                                                                                                    |
| 3   | Instance Name                             | The instance name of the SQL server should be provided. If we provide Instance name, Port number field will get disabled.                                                                                                                                                                                                                                                                                                                    |
| 4   | Port                                      | The port number of the SQL server should be provided. If we provide Port number, there is no need to provide Instance name. Port number should only be an integer.                                                                                                                                                                                                                                                                           |
| 5   | User Name                                 | A username of SQL server to authenticate.                                                                                                                                                                                                                                                                                                                                                                                                    |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 6   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                    |
| 7   | Password                                  | Provide the password of the username of MSSQL Server. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 8   | Test Connection                           | Verifies whether the connection is available or not.<br><b>NOTE:</b> Test Connection button will not work for Previous step variables. Test Connection button will only work with static values and environment variables.                                                                                                                                                                                                                   |

## 30.5 Delete Login User

### 30.5.1 Description

This Plugin is used to delete a Login User in Microsoft SQL Server.

Limitation:

This plugin is only valid for SQL Server Authentication and not Windows Authentication.

### 30.5.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                               |
|-----|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Server Name/IP                            | The Hostname/serve name/IP of the MSSQL database. This field is mandatory.                                                                                                                |
| 2   | Instance name                             | The instance name of MS SQL Server instance. Either Instance or Port Number is mandatory.                                                                                                 |
| 3   | Port Number                               | The port number of the MSSQL database. Port number should only be an integer. Port number will get disabled if an instance name is entered. Either Instance or Port Number is mandatory.  |
| 4   | Username                                  | The username having permission to take database backup (e.g.:- sa). This field is mandatory.                                                                                              |
|     | Password:                                 |                                                                                                                                                                                           |
| 5   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box. |
| 6   | Password                                  | Provide the password of the username of MSSQL Server. Password is entered using a widget. The widget handles both                                                                         |

|   |                 |                                                                                                                                                                                                                                                                                                                            |
|---|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|   | Button:         |                                                                                                                                                                                                                                                                                                                            |
| 7 | Test Connection | Verifies whether the connection is established or not.<br><b>NOTE:</b> Test Connection button does not work for Previous step fields. Test Connection button only works with static values and environment variables.                                                                                                      |

| Input Tab: |                |                                                                                   |
|------------|----------------|-----------------------------------------------------------------------------------|
| No.        | Field Name     | Description                                                                       |
|            | Input Fields:  |                                                                                   |
| 1          | Login Username | Specify the Login Username that needs to be deleted. Login username is mandatory. |

| Output Tab: |                |                                                                                                                                                                          |

| 1           | Result         | Output field to hold the result of the successful plugin execution. This field is mandatory.<br>Error Handling: <a href="#">Appendix 1: Error Handling in IT Plugins</a> |

## 30.6 Modify Data files or Log files

### 30.6.1 Description

The plugin is designed to modify Data file or Log file in MSSQL server database.

Following parameters can be modified:

1. Logical Name
2. Initial Size
3. Auto Growth

### 30.6.2 Configurations

|-----|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2   | Server Name                               | Provide the hostname/server name/IP address of SQL server instance. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3   | Instance Name                             | The instance name of the MSSQL server should be provided. If we provide Instance name, Port number field is disabled. Either Port or Instance Name is mandatory.                                                                                                                                                                                                                                                                                                                                            |
| 4   | Port                                      | The port number of the MSSQL server should be provided. If we provide Port number, there is no need to provide Instance name. Port number should only be an integer. Port number field is disabled if an instance name is entered. Either Port or Instance Name is mandatory.                                                                                                                                                                                                                               |
| 5   | User Name                                 | The username of MSSQL server to authenticate.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                   |
| 7   | Password                                  | The Password to the username to authenticate. Validate username and password to authenticate to SQL server instance. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 8   | Test Connection                           | Verifies whether the connection is established or not.<br><b>NOTE:</b> Test Connection button does not work for Previous step fields. Test Connection button only works with static values and workflow parameters/variables.                                                                                                                                                                                                                                                                               |

| Input Tab: |               |             |
|------------|---------------|-------------|
| No.        | Field Name    | Description |
|            | Input Fields: |             |

|   |                          |                                                                                                                                                                     |
|---|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Database Name            | Name of the Database on which the datafile/log file is to be created or Select from the list populated by clicking Get Database Button. This field is mandatory.    |
| 2 | Button: Get database     | Populates the list of database from the connected Instance.                                                                                                         |
| 3 | Logical Name             | Name of the data file or log file that is to be modified. This field is mandatory.                                                                                  |
| 4 | Button: Get Logical Name | Populates the list of files from the selected database.                                                                                                             |
| 5 | New Logical Name         | New name to the specified data file or log file. If value entered then Logical file name will be changed to the specified name                                      |
| 8 | Initial Size(in MB)      | Size of the file should be mentioned in MB.<br><br>If a value is provided, then it is considered that you want to modify the Initial Size of the file chosen above. |

**NOTE:** Get Database, Get File Group and Browse button does not work for previous step variables. All the buttons work only with static values and environment variables.

| Autogrowth Tab: |                            |                                                                                                                                                                                                                                                  |
|-----------------|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name                 | Description                                                                                                                                                                                                                                      |
|                 | Autogrowth Fields:         |                                                                                                                                                                                                                                                  |
| 1               | Enable Autogrowth          | Acceptable values are “Yes” or “No”. These are visible when you hover over the field. When value is Yes, it is considered that you want to enable Autogrowth for the file.<br>If No is selected any entries made in the fields below is ignored. |
|                 | File Growth:               |                                                                                                                                                                                                                                                  |
| 2               | Growth In Percent /In MB   | Acceptable values are Percent or MB. If Percent is chosen then you specify growth value in percent below. If MB is chosen you are specifying an absolute value for file growth.                                                                  |
| 3               | Value                      | Specify the value for growth of a file in percent or MB as chosen above.                                                                                                                                                                         |
|                 | Maximum File Size:         |                                                                                                                                                                                                                                                  |
| 4               | Unrestricted File Growth   | Acceptable values are “Yes” or “No”. These are visible when you hover over the field. When value is Yes, you allow the Unlimited growth of the file.<br>If Yes is selected any entries in the field below are ignored.                           |
| 5               | Restricted File Growth(MB) | If Unrestricted File Growth is No, specify the Restricted size to the file in MB                                                                                                                                                                 |

| Output Tab: |                |                                                                                                                     |

| No.         | Field Name     | Description                                                                                                         |
|             | Output Fields: |                                                                                                                     |
| 1           | Result         | Provide the name of an output field to hold the result of the successful plugin execution. This field is mandatory. |

#### Known Issue:

When you select values for Instance name or Port field from a previous step input (i.e. Generate Rows or Microsoft Excel Input etc.) the corresponding Port or Instance name is disabled but may be unlocked when revisited

## 30.7 Reset Login User Password

### 30.7.1 Description

This Plugin is used to reset the password for the specified Login User of Microsoft SQL Server.

This plugin is only valid for SQL Server Authentication and not Windows Authentication.

### 30.7.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                |
|-----|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Server Name/IP                            | The Hostname/serve name/IP of the MSSQL database. This field is mandatory.                                                                                                                                                                                 |
| 2   | Instance name                             | The instance name of MS SQL Server instance. Either Instance or Port Number is mandatory.                                                                                                                                                                  |
| 3   | Port Number                               | The port number of the MSSQL database. Port number should only be an integer. Port number will get disabled if an instance name is entered. Either Instance or Port Number is mandatory.                                                                   |
| 4   | Username                                  | The username having permission to reset login user password (e.g. sa)                                                                                                                                                                                      |
|     | Password:                                 |                                                                                                                                                                                                                                                            |
| 5   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                  |
| 6   | Password                                  | The password of the user to authenticate to MSSQL servers. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory. |

|   |                 |                                                                                                                                                                                                                       |
|---|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.                                       |
|   | Button:         |                                                                                                                                                                                                                       |

## 30.8 Shrink Database

### 30.8.1 Description

The plugin is designed to shrink database in SQL server. Most databases require some free space to be available for regular day-to-day operations. If you shrink a database repeatedly and notice that the database size grows again, this indicates that the space that was shrunk is required for regular operations.

### 30.8.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2   | Server Name                               | The IP address of remote machine on which SQL server instance is present should be given.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 3   | Instance Name                             | The instance name of the MSSQL server should be provided. If we provide Instance name, Port number field will get disabled.                                                                                                                                                                                                                                                                                                                                                                                        |
| 4   | Port                                      | The port number of the MSSQL server should be provided. If we provide Port number, there is no need to provide Instance name. Port number should only be an integer. Port number field is disabled if an instance name is entered.                                                                                                                                                                                                                                                                                 |
| 5   | Username                                  | The username of MSSQL server to authenticate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 6   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                          |
| 7   | Password                                  | <p>The Password to the username to authenticate. Validate username and password to authenticate to SQL server instance. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 8   | Test Connection                           | <p>Verifies whether the connection is established or not.</p> <p><b>NOTE:</b> Test Connection button does not work for Previous step fields. Test Connection button only works with static values and environment variables.</p>                                                                                                                                                                                                                                                                                   |

| Input Tab: |               |                                                                                                                                                       |

## 30.9 Shrink Files

### 30.9.1 Description

The plugin is designed to shrink the size of the data and log files in the specified database of SQL server.

### 30.9.2 Configurations

| No. | Field Name    | Description                                                                                                                                                                        |
|-----|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name     | Name of the step. This name has to be unique in a single workflow.                                                                                                                 |
|     | Connection:   |                                                                                                                                                                                    |
| 2   | Server Name   | The IP address of remote machine on which MSSQL server instance is present should be given.                                                                                        |
| 3   | Instance name | The instance name of the MSSQL server should be provided. If we provide Instance name, Port number field will get disabled.                                                        |
| 4   | Port          | <p>The port number of the MSSQL server should be provided. If we provide Port number, there is no need to provide Instance name.</p> <p>Port number should only be an integer.</p> |
| 5   | User Name     | The username of MSSQL server to authenticate.                                                                                                                                      |
|     | Password:     |                                                                                                                                                                                    |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                          |
| 7 | Password                                  | <p>The Password to the username to authenticate. Validate username and password to authenticate to SQL server instance. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |
|   | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 8 | Test Connection                           | <p>Verifies whether the connection is available or not. Validates username and password to authenticate to MSSQL server instance.</p> <p><b>NOTE:</b> Test Connection button will not work for Previous step variables. Test Connection button will only work with static values and environment variables.</p>                                                                                                                                                                                                    |

| Input Tab: |                 |                                                                                                                                                             |
|------------|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name      | Description                                                                                                                                                 |
|            | Input Fields:   |                                                                                                                                                             |
| 1          | Database        | Name of the Database for which data or log file is to be shranked. Field value is to be selected from the prompt by clicking on the Select database button. |
| 2          | Select database | Clicking on this button brings a dialog for the available databases on that particular SQL server instance.                                                 |
| 3          | File type       | Type of the files to be deleted of a particular database i.e. Data files, Log files must be selected.                                                       |
| 4          | File name       | Name of the file to be shranked must be selected. Field value is to be selected from the prompt by clicking on the Select file button.                      |
| 5          | Select file     | Clicking on this button brings a dialog for the available files of a particular database.                                                                   |

## 30.10 Start SQL Agent Job

This plugin is designed to Start Agent Job to handle other automated tasks.

This step only ensures start of SQL agent job and not monitoring the completion of action(s) (successful execution) present in the job.

Prerequisites:

1. SQL Server instance and access details
2. SQL Server Browser service must be enabled on remote machine.
3. SQL Server Agent must be enabled.
4. **sqljdbc4-4.0.jar** must be present in lib folder of Process Studio as well as AE agent.
5. SQL Server has the following **msdb** database fixed database roles, which gives administrators control over access to SQL Server Agent. The roles are:
  - SQL Agent User Role
  - SQL Agent Reader Role
  - SQL Agent Operator Role

### 30.10.1 Description

This plugin is designed to Run or start Agent Job to handle other automated tasks.

### 30.10.2 Configurations

| No. | Field Name  | Description                                                        |
|-----|-------------|--------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|     | Connection: |                                                                    |

|   |                 |                                                                                                                                                                                                                                                                                                |
|---|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Server Name/IP  | The IP address of remote machine on which MSSQL server instance is present should be given.                                                                                                                                                                                                    |
| 3 | Instance name   | The instance name of the MSSQL server should be provided. If we provide Instance name, Port number field will get disabled.                                                                                                                                                                    |
| 4 | Port Number     | The port number of the MSSQL server should be provided. If we provide Port number, there is no need to provide Instance name.                                                                                                                                                                  |
| 5 | Username        | The username of MSSQL server to authenticate.                                                                                                                                                                                                                                                  |
| 6 | Password        | The Password to the username to authenticate.                                                                                                                                                                                                                                                  |
|   | Button:         |                                                                                                                                                                                                                                                                                                |
| 7 | Test Connection | Verifies whether the connection is established or not. Validates username and password to authenticate to MSSQL server instance<br><b>NOTE:</b> Test Connection button does not work for Previous step fields. Test Connection button only works with static values and environment variables. |

| Input Tab: |               |                                                                                                                                                                                                                                                      |

## 30.11 Stop SQL Agent Job

### 30.11.1 Description

This plugin is designed to stop Agent Job of particular SQL server agent to handle other automated tasks.

### 30.11.2 Configurations

| No. | Field Name      | Description                                                                                                                                                                                                                                                                                    |
|-----|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                             |
|     | Connection:     |                                                                                                                                                                                                                                                                                                |
| 2   | Server Name/IP  | The IP address or fully qualified domain name of the machine on which MSSQL server instance is present.                                                                                                                                                                                        |
| 3   | Instance name   | The instance name of the MSSQL server should be provided. If we provide Instance name, Port number field will get disabled.                                                                                                                                                                    |
| 4   | Port Number     | The port number of the MSSQL server should be provided. If we provide Port number, there is no need to provide Instance name.                                                                                                                                                                  |
| 5   | Username        | The username of MSSQL server to authenticate.                                                                                                                                                                                                                                                  |
| 6   | Password        | The Password to the username to authenticate.                                                                                                                                                                                                                                                  |
|     | Button:         |                                                                                                                                                                                                                                                                                                |
| 7   | Test Connection | Verifies whether the connection is established or not. Validates username and password to authenticate to MSSQL server instance<br><b>NOTE:</b> Test Connection button does not work for Previous step fields. Test Connection button only works with static values and environment variables. |

| Input Tab: |               |                                                                                                                                                                                                                                                              |

|             | Output Fields: |                                                                                                                                                                                |
| 1           | Result         | Output field to hold the result of the successful plugin execution.is field is mandatory.<br>Error Handling:<br>Refer <a href="#">Appendix 1: Error Handling in IT Plugins</a> |

## 31 MS Word

MS Word Plugin has been designed to perform operations with MS Word files.

### 31.1 MS Word: Convert To PDF

#### 31.1.1 Description

MS Word: Convert to PDF plugin step converts one or more word documents to PDF files.

**Compatibility:** PDF 1.5 and above

**Prerequisite:** Ensure that MS Office version 2010 or higher is installed on the agent machine.

**Limitations:**

- This step is not compatible with Linux OS.
- When uploading file on AutomationEdge server, the allowed file size is upto 200 MB. This is a limitation from AutomationEdge server side.

**Note:** This step should be preceded with a row generating step (e.g. Generate rows etc.)

**31.1.2 Configurations**

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

| Input Tab: |                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|            | Input Fields:          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 1          | Input File/Directory   | Specify the file path of the word file or a directory with word files to be converted to PDF. The word files with the following extensions are allowed: <b>.docx</b> , <b>.doc</b> and <b>.rtf</b> .<br>The data type of this field is String. This field is mandatory.<br><br><b>Note:</b> Input File of type .docx does not support Runtime parameter of type File, on AE Server. Input File parameter can be provided as a string Type to specify the full file path. This issue will be resolved in upcoming AE Releases. |
| 2          | Button: Browse File... | Click on this button brings up the dialog to browse the input file path.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 3          | Button: Folder...      | Click on this button brings up the dialog to browse the input directory path.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 4          | Output Directory       | Specify the path of the directory where the output PDF files are to be generated.<br>The data type of this field is String. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                          |
| 5          | Button: Folder...      | Click on this button brings up the dialog to browse the output directory path.                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| 1 | OK     | <p>On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.</p> <p>If all the required field values are provided then it will save the field values.</p> |
| 2 | Cancel | On click of this button, it will cancel the window and do not save any values                                                                                                                                                                     |

## 31.2 MS Word: Mail Merge

### 31.2.1 Description

Mail merge plugin step creates multiple documents in bulk at once based on a template as a reference. These documents have identical layout, formatting, text, and graphics. The template has fieldnames (tags) which are replaced in each document. Hence, the documents vary for personalization.

You may import variable / personalized data from external sources such as database, excel or CSV file and other sources in Process Studio that can be passed as fields to this step to replace placeholders in the template file.

### 31.2.2 Configurations

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

## 32 MySQL Server

MySQL Server plugin has been designed to perform tasks on MySQL database.

### Compatibility:

- MySQL Server - instance and access details, Version 8.0.18 for 64 bit

### Prerequisites:

- MySQL-connector-java-8.0.28.jar** must be present in the lib folder of Process Studio as well as AutomationEdge Agent.

### Known Errors:

For Server Port field if any random value is provided then it might not throw a proper error, as there is no validation done for this field to be an integer only.

## 32.1 MySQL Server: Create Database

### 32.1.1 Description

MySQL Server: Create Database step is used to create a new database in MySQL server.

### 32.1.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                               |

| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                   |
| 2   | Server IP                                 | <p>The Hostname/Server Name/IP of the MySQL Server.</p> <p>This field is mandatory.</p>                                                                                                                                                                                                           |
|     |                                           |                                                                                                                                                                                                                                                                                                   |
| 3   | Port                                      | <p>The port number of the MySQL Server. Only variables/static values are allowed.</p> <p>This field is mandatory.</p>                                                                                                                                                                             |
| 4   | Username                                  | <p>A username of the MySQL Server.</p> <p>This field is mandatory.</p>                                                                                                                                                                                                                            |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                   |
| 5   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                         |
| 6   | Password                                  | <p>Provide the password of the username of MySQL Server.</p> <p>This field is mandatory.</p> <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> |

|            |                    | If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.                                              |
|------------|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | Button:            |                                                                                                                                                                                                                              |
| 7          | Test Connection    | Verifies whether the connection is established or not.<br><br><b>Note:</b><br>Test Connection button does not work for previous step fields. Test Connection button only works with static values and environment variables. |
| Input Tab: |                    |                                                                                                                                                                                                                              |
| No.        | Field Name         | Description                                                                                                                                                                                                                  |
|            | Input Fields:      |                                                                                                                                                                                                                              |
| 1          | Username to unlock | Specify the Username to be unlocked.                                                                                                                                                                                         |
| 2          | Host Name          | Specify the Hostname/Server Name/IP address of the user's machine.                                                                                                                                                           |

| Common Buttons: |            |                                                                                                                                                                                                                                            |
|-----------------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                                |
|                 | Buttons:   |                                                                                                                                                                                                                                            |
| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

## 33 OCR

OCR Plugin steps have been designed to convert images to text with tools using Optical Character Recognition technology.

## 33.1 OCR: Google Vision

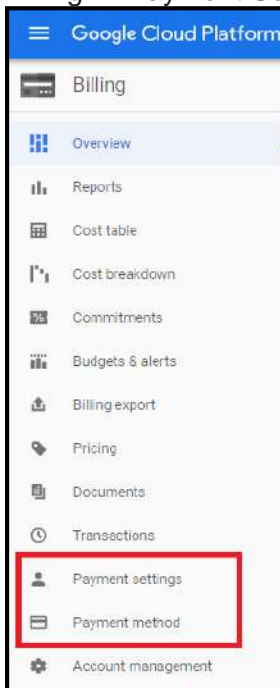

### 33.1.1 Description

OCR: Google Vision plugin step detects and extracts text from an image and provides text output in JSON format.

#### Prerequisites:

- Create a Google Cloud Vision API key  
[https://cloud.google.com/docs/authentication/api-keys?hl=en&visit\\_id=637051029162974596-3924725435&rd=1#creating\\_an\\_api\\_key](https://cloud.google.com/docs/authentication/api-keys?hl=en&visit_id=637051029162974596-3924725435&rd=1#creating_an_api_key)
- Add restrictions to API keys  
[https://cloud.google.com/docs/authentication/api-keys#api\\_key\\_restrictions](https://cloud.google.com/docs/authentication/api-keys#api_key_restrictions)
- Fill the details under the following as seen in the snapshot below,

Billing -> Payment Settings and Billing -> Payment Method for API Key to work.

### 33.1.2 Configurations

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

|    |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7  | API Key:                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 8  | Accept Value as variable/static | Leave checkbox unchecked to accept API Key value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for API Key field to appear as Text box.                                                                                                                                                                                                                                                                                                                            |
| 9  | API Key                         | <p>Specify the API Key for authentication to Google Cloud Platform. This field is mandatory. API Key is encrypted and is not stored in the .psw file.</p> <p>API Key is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled API Key field appears as Text box. Else if checkbox above is disabled API Key field appears as a drop down to select fields from previous steps.</p> |
| 10 | Button: Test Connection         | <p>Test connection with the API provided. Verifies whether the connection is available or not.</p> <p><b>Note:</b> If the connection fields are provided from previous step, then Test Connection Button does not work.</p>                                                                                                                                                                                                                                                                                        |

| Input Tab: |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

## 33.2 OCR: Tesseract

### 33.2.1 Description

OCR: Tesseract plugin step detects and extracts text from an image to a readable text type. Supported image types: BMP, PNG, JPG, JPEG.

**Compatibility:** Tesseract version 4.0.0.

#### Prerequisites:

- Download tessdata(tesseract-ocr) version 4.0.0.  
<https://github.com/tesseract-ocr/tessdata>

- After download, extract it and put it on the processing machine on a particular path. You will need to specify this path in the 'Data Folder Path' in the step.
- Install Microsoft Visual C++ Redistributable for Visual Studio 2015, 2017, and 2019 (32 bit & 64 bit)
  - [https://aka.ms/vs/16/release/vc\\_redist.x64.exe](https://aka.ms/vs/16/release/vc_redist.x64.exe) or
  - [https://aka.ms/vs/16/release/vc\\_redist.x86.exe](https://aka.ms/vs/16/release/vc_redist.x86.exe)

### 33.2.2 Configurations

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

| Input Tab: |                   |                                                                                                                                                                                                                                                                                                                                                         |
|------------|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name        | Description                                                                                                                                                                                                                                                                                                                                             |
|            | Input Fields:     |                                                                                                                                                                                                                                                                                                                                                         |
| 1          | Data Folder Path  | Specify the Tesseract data folder path or click the Browse button to browse the folder path (data folder path is mentioned in the prerequisites).<br>The data type is String. This field is mandatory.                                                                                                                                                  |
| 2          | Button: Browse    | Clicking on this button brings up the dialog to browse the Tesseract data folder path.                                                                                                                                                                                                                                                                  |
| 3          | File Path         | Specify the path of the input image file to extract readable text. Alternately browse the file path.<br><b>Note:</b> Supported image types are BMP, PNG, JPG, JPEG<br>The data type is String. This field is mandatory.                                                                                                                                 |
| 4          | Button: Browse    | Clicking on this button brings up the dialog to browse the image File path.                                                                                                                                                                                                                                                                             |
| 5          | Language Code     | Specify Language. (e.g. eng for English, hin for Hindi, urd for Urdu). Multiple languages can be passed. Add '+' sign to extract multi-language output.<br><br>For language code refer URL:<br><a href="https://muthu.co/all-tesseract-ocr-options/">https://muthu.co/all-tesseract-ocr-options/</a><br>Default value is: eng. The data type is String. |
| 6          | Page Segment Mode | Select Page Segmentation Mode required as per the input file type. Allowed values are 0-13. The data type is String.                                                                                                                                                                                                                                    |

|  |                                                                                   |
|--|-----------------------------------------------------------------------------------|
|  | Please refer table below for a list of Page Segmentation Mode with a description. |
|--|-----------------------------------------------------------------------------------|

| Sr. No. | Page Segment Mode | Description                                                                                   |
|---------|-------------------|-----------------------------------------------------------------------------------------------|
| 1       | 0                 | Orientation and script detection (OSD) only.                                                  |
| 2       | 1                 | Automatic page segmentation with OSD.                                                         |
| 3       | 2                 | Automatic page segmentation, but no OSD, or OCR.                                              |
| 4       | 3                 | Fully automatic page segmentation, but no OSD. (Default)                                      |
| 5       | 4                 | Assume a single column of text of variable sizes.                                             |
| 6       | 5                 | Assume a single uniform block of vertically aligned text.                                     |
| 7       | 6                 | Assume a single uniform block of text.                                                        |
| 8       | 7                 | Treat the image as a single text line.                                                        |
| 9       | 8                 | Treat the image as a single word.                                                             |
| 10      | 9                 | Treat the image as a single word in a circle.                                                 |
| 11      | 10                | Treat the image as a single character.                                                        |
| 12      | 11                | Sparse text. Find as much text as possible in no particular order.                            |
| 13      | 12                | Sparse text with OSD.                                                                         |
| 14      | 13                | Raw line. Treat the image as a single text line, bypassing hacks that are Tesseract-specific. |

**Output Tab:**

| No. | Field Name    | Description                                                                                                     |
|-----|---------------|-----------------------------------------------------------------------------------------------------------------|
|     | Output Field: |                                                                                                                 |
| 1   | Output Text   | Specify an output field to hold converted text on successful plugin execution. The default value is OutputText. |

**Common Buttons:**

| No. | Field Name | Description                                                                                                                                      |
|-----|------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Buttons:   |                                                                                                                                                  |
| 1   | OK         | On click of this button. It will check the field values. If any required field values are missing then it will display validation error message. |

|   |        |                                                                                   |
|---|--------|-----------------------------------------------------------------------------------|
|   |        | If all the required field values are provided then it will save the field values. |
| 2 | Cancel | On click of this button, it will cancel the window and do not save any values     |

## 34 Office365

Office365 plugin steps have been created to perform tasks on O365.

### Compatibility:

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

### Prerequisites:

- Microsoft Account with the required O365 App Authentication and Permissions (Refer Office 365 App Registration ).
- Tenant ID, Client ID and Client Secret should be known for Authentication.
- Provide access (whitelist) to the following URLs through your firewall and network:
  - <https://graph.microsoft.com>
  - <https://login.microsoftonline.com>

### References:

- <https://docs.microsoft.com/en-us/graph/api/resources/groups-overview?view=graph-rest-1.0>

### 34.1 Office 365: Add Member to Group

#### Compatibility:

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

#### Prerequisites:

- Tenant ID, Client ID and Client Secret should be known.
  - The Microsoft Account should have the required O365 App Authentication and Permissions (Refer [Office 365 App Registration](#) ).
- Additionally, to Add Member to Group in Office365 following are the permissions needed.

| Permission type | Permission (from least to most privileged) |
|-----------------|--------------------------------------------|
|                 |                                            |

|             |                                                                         |
|-------------|-------------------------------------------------------------------------|
| Application | GroupMember.ReadWrite.All, Group.ReadWrite.All, Directory.ReadWrite.All |
|-------------|-------------------------------------------------------------------------|

- <https://github.com/microsoftgraph/microsoft-graph-docs/issues/546>

**Limitation:**

Users can only be added to Office 365 Groups.

**34.1.1 Description**

Office 365: Add Member to Group plugin step adds an Office 365 user to a Group.

**34.1.2 Configurations**

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                        |
|-----|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                 |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                    |
| 2   | Tenant ID                       | Tenant ID of Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                           |
| 3   | Client ID                       | Client ID of the Application created in Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                |
|     | Client Secret:                  |                                                                                                                                                                                                                                                                                                                                                                                    |
| 4   | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                                |
| 5   | Client Secret                   | Specify the Client Secret generated in Microsoft Account.<br><br>Client Secret is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Client Secret field appears as a Text box and accepts static or variable values. Else if checkbox above is |

|   |                         |                                                                                                                                                                                                                                                                                                                                                                |
|---|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                         | <p>disabled Client Secret field appears as a drop down to select fields from previous steps.</p> <p>The data type is secure string. This field is mandatory.</p>                                                                                                                                                                                               |
| 6 | Button: Test Connection | <p>Test connection with Client ID and Client Secret provided. Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p> |

|            | Input Fields:  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1          | Group Email/ID | <p>Specify The Email address or Group ID of the group to which member is to be added.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• After successful execution, the added member takes some time to get reflected on the instance.</li> <li>• To add member to security group use Group ID as security group doesn't have email address.</li> <li>• We cannot add members to Mail-Enabled Security Group through the plugin step.</li> </ul> |
| 2          | Button: Get    | Click to display the list of all the available emails of the group.                                                                                                                                                                                                                                                                                                                                                                                             |
| 3          | User Email     | Specify the email address of the user.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 4          | Button: Get    | <p>Click to display list of all the available emails of the user.</p> <p><b>Note:</b> Get button fetches only top 100 User Emails.</p>                                                                                                                                                                                                                                                                                                                          |

## 34.2 Office 365: Assign License

### Prerequisites:

| Permission Type | Permission Name (from least to most privileged) |
|-----------------|-------------------------------------------------|
| Application     | User.ReadWrite.All, Directory.ReadWrite.All     |

### Additional References:

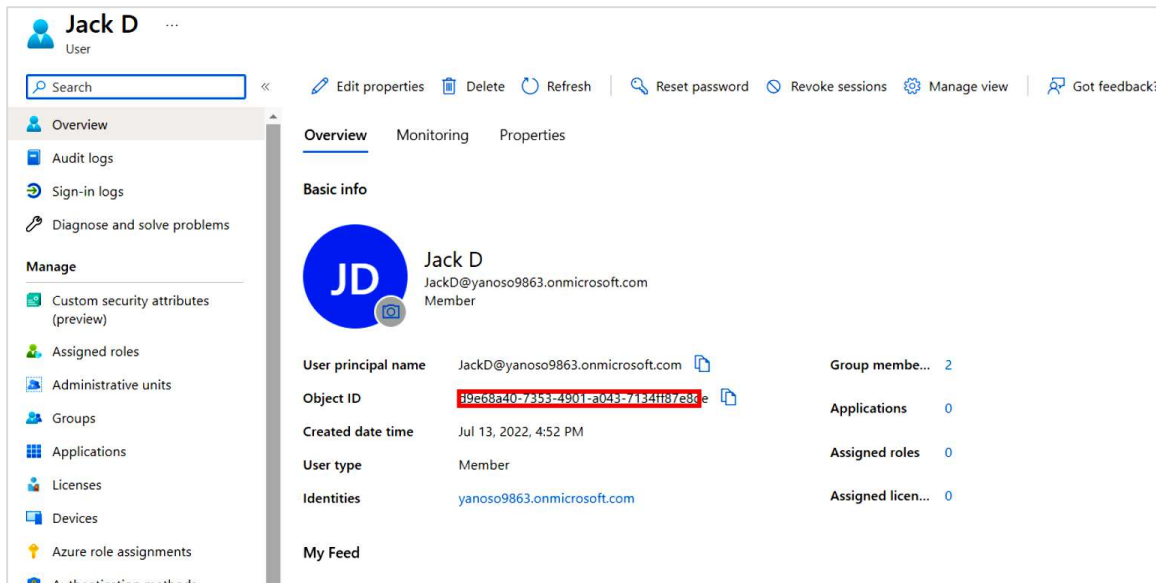

- <https://docs.microsoft.com/en-us/graph/api/user-assignlicense?view=graph-rest-1.0>

### 34.2.1 Description

Office 365: Assign License plugin step assigns a specified License to an Office 365 user.

#### Note:

- To generate the Tenant ID, Client ID, Client Secret, and provide permissions, see [Appendix: O365 App Registration, Authentication and Permissions in Azure](#).
- Product names and service plan identifiers for licensing. Click the following link to get the Subscription name or SKU ID (**GUID**) and apps (**Service plans included**): <https://learn.microsoft.com/en-us/azure/active-directory/enterprise-users/licensing-service-plan-reference>
- To get the user ID, see the following screenshot:

### 34.2.2 Configurations

| No. | Field Name  | Description                                                                       |
|-----|-------------|-----------------------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow.                |
|     | Connection: |                                                                                   |
| 2   | Tenant ID   | Tenant ID of Microsoft Account. The data type is string. This field is mandatory. |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Client ID                       | Client ID of the Application created in Microsoft Account. The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                             |
|   | Client Secret:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                                                                                                                                                                                      |
| 5 | Client Secret                   | Specify the Client Secret generated in Microsoft Account.<br><br>Client Secret is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Client Secret field appears as a Text box and accepts static or variable values. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.<br>The data type is secure string. This field is mandatory. |
| 6 | Button: Test Connection         | Test connection with Client ID and Client Secret provided. Verifies whether the connection is established or not.<br>Note: For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                             |

| Input Tab: |                              |                                                                                                                                                                                                                 |
|------------|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name                   | Description                                                                                                                                                                                                     |
|            | Input Fields:                |                                                                                                                                                                                                                 |
| 1          | Step Name                    | Name of the step. This name has to be unique in a single workflow.                                                                                                                                              |
| 2          | Subscription Name (SKU Name) | Select the subscriptions that is available on the tenant. The data type is string. This field is mandatory.                                                                                                     |
| 3          | Button: Get                  | Displays list of all the available subscriptions.                                                                                                                                                               |
| 4          | User Email                   | Provide the email address of the user.                                                                                                                                                                          |
| 5          | Button: Get                  | Click to Display the list of all the available user's emails. It Can only fetch the top 100 User Emails.                                                                                                        |
| 6          | Apps To Be Disabled          | Select the apps to be disabled under a particular license from the table.<br><br><b>Note:</b> In the Apps To Be Disabled table, if both cells contain values, priority is given to the Static Apps column cell. |

|   |               |                                                                                                                                                |
|---|---------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 | Variable Apps | Select input from a previous step or as workflow parameters in the column, which will set the apps to disable from the license to be assigned. |
| 8 | Static Apps   | Click on a cell in the column, which will populate the apps to be disabled from the license to be assigned.                                    |

### 34.3 Office 365: Create Event

**Prerequisite:**

| Permission type                    | Permission (from least to most privileged) |
|------------------------------------|--------------------------------------------|
| Delegated (work or school account) | Calendars.ReadWrite<br>offline_access      |

#### 34.3.1 Description

Office 365: Create Event plugin step creates the event on the user’s calendar.

#### 34.3.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                         |
|-----|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                  |
|     | Connection:                     |                                                                                                                                                                                                     |
| 2   | Grant Type                      | Select the type of grant from Password Grant or Refresh Token.<br><br>The data type is string. This field is mandatory.<br><br>Note: It is recommended to select the grant type from Refresh Token. |
| 3   | Tenant ID                       | Tenant ID of Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                                            |
| 4   | Client ID                       | Client ID of the Application created in Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                 |
|     | Client Secret:                  |                                                                                                                                                                                                     |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box. |

|    |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6  | Client Secret           | <p>Specify the Client Secret generated in Microsoft Account.</p> <p>Client Secret is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Client Secret field appears as a Text box and accepts static or variable values. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.</p> <p>The data type is secure string. This field is mandatory.</p> |
| 7  | Username                | Specify the name of the user whose email attachments are to be downloaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 8  | Password                | Specify the password for the provided user name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 9  | Refresh Token           | Specify the refresh token required to authenticate the details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 10 | Button: Test Connection | <p>Test connection with Client ID and Client Secret provided. Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                      |

Input Tab:

| No. | Field Name    | Description                                                                                                                                                                                  |
|-----|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Input Fields: |                                                                                                                                                                                              |
| 1   | Time Zone     | <p>Specify the applicable time zone.</p> <p>The data type is string. This field is mandatory.</p> <p>Note: Only Windows Standard Time Zones are supported.</p>                               |
| 2   | Get           | Click to select the time zone from the dialog.                                                                                                                                               |
| 3   | Start Date    | <p>Select the date when the meeting is supposed to start.</p> <p>The data type is string. This field is mandatory.</p> <p>Note: Date format supported are 'YYYY-MM-DD' and 'YYYY/MM/DD'.</p> |

|    |                           |                                                                                                                                                                                     |
|----|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4  | Start Time                | Select the time when the meeting is supposed to start.<br><br>The data type is string. This field is mandatory.<br><br>Note: Time format supported is 'hh:mm aa'. Ex: 09:30 AM      |
| 5  | End Date                  | Select the date when the meeting is supposed to end.<br><br>The data type is string. This field is mandatory.<br><br>Note: Date format supported are 'YYYY-MM-DD' and 'YYYY/MM/DD'. |
| 6  | End Time                  | Select the time when the meeting is supposed to end.<br><br>The data type is string. This field is mandatory.<br><br>Note: Time format supported is 'hh:mm aa'. Ex: 09:30 AM        |
| 7  | Subject                   | Specify the subject of the event.                                                                                                                                                   |
| 8  | Location                  | Specify the location where meeting is supposed to happen.                                                                                                                           |
| 9  | Content                   | Specify the contents of the event.                                                                                                                                                  |
| 10 | Is Online Meeting         | Specify if the meeting is online or not.                                                                                                                                            |
| 11 | Online Meeting Provider   | Specify the details of the online meeting provider.                                                                                                                                 |
| 12 | Required Attendees Emails | Provide the list of emails of attendees required for the meeting.                                                                                                                   |
| 13 | Optional Attendees Emails | Provide the list of emails of optional attendees required for the meeting.                                                                                                          |
| 14 | Resources Emails          | Provide the resources that are required for the meeting.                                                                                                                            |

| Output Tab: |                |                                                                                                                                             |
|-------------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| No.         | Field Name     | Description                                                                                                                                 |
|             | Output Fields: |                                                                                                                                             |
| 1           | Meeting ID     | Specify the unique meeting ID.                                                                                                              |
| 2           | Join URL       | Specify the URL that the attendees must click to join the meeting.<br><br>Note: For other domain, this step will not generate the join URL. |

## 34.4 Office 365: Create Office 365 Group

### Compatibility:

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

**Prerequisites:**

- Tenant ID, Client ID and Client Secret should be known.
- The Microsoft Account should have the required O365 App Authentication and Permissions (Refer [Office 365 App Registration](#) ).  
Additionally, to Create Group in Office365 the following permissions are needed.

| Permission type | Permission (from least to most privileged)                 |
|-----------------|------------------------------------------------------------|
| Application     | Group.Create, Group.ReadWrite.All, Directory.ReadWrite.All |

**References:**

<https://docs.microsoft.com/en-us/graph/api/group-post-groups?view=graph-rest-1.0&tabs=cs>

**34.4.1 Description**

Office 365: Create Office 365 Group plugin step creates an Office 365 Group.

**34.4.2 Configurations**

| No. | Field Name                      | Description                                                                                                                                                                                                                                            |

| 1   | User Email     | Specify an output field to hold the email address of the user created.<br><br>In case of step failure, the term userPrincipalName The user principal name (the combination of User Name and Domain Name) is referred in the error message returned from the API JSON when the existing User Name is provided while creating the new user. |

## 34.7 Office 365: Delete Group

**Compatibility:**

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

**Prerequisites:**

- Tenant ID, Client ID and Client Secret should be known.
- The Microsoft Account should have the required O365 App Authentication and Permissions (Refer Office 365 App Registration ).  
Additionally, Office365 Delete Group Step needs the following permissions.

| Permission type | Permission Name (from least to most privileged) |
|-----------------|-------------------------------------------------|
| Application     | Group.ReadWrite.All                             |

**References:**

<https://docs.microsoft.com/en-us/graph/api/group-delete?view=graph-rest-1.0>

**34.7.1 Description**

Office 365: Delete Group plugin step deletes an Office 365 group.

**34.7.2 Configurations**

| 1 | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|   | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 2 | Tenant ID                       | Tenant ID of Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 3 | Client ID                       | Client ID of the Application created in Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                      |
|   | Client Secret:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                                                                                                                                                                                      |
| 5 | Client Secret                   | Specify the Client Secret generated in Microsoft Account.<br><br>Client Secret is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Client Secret field appears as a Text box and accepts static or variable values. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.<br>The data type is secure string. This field is mandatory. |
| 6 | Button: Test Connection         | Test connection with Client ID and Client Secret provided. Verifies whether the connection is established or not.<br><br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                  |

| Input Tab: |               |                                                                                                                    |
|------------|---------------|--------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name    | Description                                                                                                        |
|            | Input Fields: |                                                                                                                    |
| 1          | User Email    | Email address of the user.<br>The data type is String. This field is mandatory.                                    |
| 2          | Button: Get   | Click on Get button to display a list of all the available user's emails. It fetches only the top 100 User Emails. |

### 34.9 Office 365: Download Email Attachment

**Compatibility:**

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

**Prerequisites:**

- Tenant ID, Client ID and Client Secret, ‘Username and Password’ or Refresh Token based on Grant Type should be known.
- The Microsoft Account should have the required O365 App Authentication and Permissions (Refer Office 365 App Registration or [Appendix: Office 365 App Registration for Grant Type Refresh Token](#)).
- For Office365 download emails attachment the following are the permissions needed. See the following image:

| API / Permissions name                                       | Type      | Description                        |
|--------------------------------------------------------------|-----------|------------------------------------|
| <span style="font-size: small;">▼ Microsoft Graph (6)</span> |           |                                    |
| Mail.Read                                                    | Delegated | Read user mail                     |
| Mail.ReadWrite                                               | Delegated | Read and write access to user mail |
| openid                                                       | Delegated | Sign users in                      |

| Permission Type | Permission Name |
|-----------------|-----------------|
| Delegated       | Mail.ReadWrite  |
| Delegated       | Openid          |

| 1          | Message ID        | Provide Message ID of the email for which attachments are to be downloaded.<br>You may fetch Message ID using the O365: Email Message Input Step.<br>The data type is String. This field is mandatory.          |
| 2          | Attachment Folder | Specify the Folder path where mail attachments are to be saved.<br>The data type is String. This field is mandatory.<br><br><b>Note:</b> If the folder is not present the complete folder path will be created. |
| 3          | Button: Browse    | Click Get button to Browse the Attachment Folder path.                                                                                                                                                          |

### 34.10 Office 365: Email Message Input

**Compatibility:**

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

**Prerequisites:**

- Tenant ID, Client ID and Client Secret, 'Username and Password' or Refresh Token based on Grant Type should be known.
- The Microsoft Account should have the required O365 App Authentication and Permissions (Refer Office 365 App Registration or [Appendix: Office 365 App Registration for Grant Type Refresh Token](#)).
- Additionally, Office365 Email Messages Input Step needs the following permissions to fetch emails. See the following image:

| API / Permissions name | Type      | Description                        |
|------------------------|-----------|------------------------------------|
| Microsoft Graph (6)    |           |                                    |
| Mail.Read              | Delegated | Read user mail                     |
| Mail.ReadWrite         | Delegated | Read and write access to user mail |
| openid                 | Delegated | Sign users in                      |

| Permission Type | API /Permission name      |
|-----------------|---------------------------|
| Delegated       | Mail.ReadBasic, Mail.Read |
| Delegated       | offline_access            |

|---|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                  | <b>Note:</b> It must be a valid email folder and the folder name must not contain slash(/).                                                                                                                                                                                                                                                 |
| 2 | Get                              | Displays a list of Folders for email account.                                                                                                                                                                                                                                                                                               |
| 3 | Retrieve                         | Select from the following retrieve options: <ul style="list-style-type: none"> <li>• Get All Messages</li> <li>• Get unread messages.</li> </ul>                                                                                                                                                                                            |
| 4 | Retrieve The Top ... Emails      | Provide the positive integer value to fetch top n emails. This field is optional. Retrieve The Top ... Emails value is ignored if 'Fetch in Batches' below is 'Yes'.                                                                                                                                                                        |
| 5 | Retrieve Emails In Reverse Order | Allowed values: 'Yes', 'No'. Provide 'Yes' to fetch in reverse order i.e. Old to New. This field is optional.                                                                                                                                                                                                                               |
| 6 | Mark As Read                     | Allowed values: 'Yes', 'No'. Provide 'Yes' if fetched mails are to be marked as read. This field is optional.                                                                                                                                                                                                                               |
|   | Batch:                           |                                                                                                                                                                                                                                                                                                                                             |
| 7 | Fetch in Batches                 | Allowed values: 'Yes', 'No'. Provide 'Yes' to fetch in batches.<br><b>Note:</b> <ul style="list-style-type: none"> <li>• If Retrieve Emails In Reverse Order and Fetch In Batches both are selected then the batches are reversed.</li> <li>• Retrieve The Top ... Emails value is ignored if 'Fetch in Batches' below is 'Yes'.</li> </ul> |
| 8 | Batch Size                       | This field is enabled if the checkbox above is selected. Provide the positive integer value for the size of the batch to be fetched. If 'Yes' is provided in 'Fetch in Batches' field above, a value must be provided.                                                                                                                      |
| 9 | Limit                            | Provide a positive integer which is an upper limit for the total number of emails to fetch. You may optionally provide a value if Yes is provided in field 'Fetch in Batches' above.                                                                                                                                                        |

| No. | Field Name | Description                                                                                                                                                                         |
|-----|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Header:    | <b>Note:</b> If multiple filters are used from the below list, then AND operator is used for filters. The data type of all fields in the Header is String. The fields are optional. |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Sender          | Provide the mail address to filter mails by Sender.                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 2 | Recipient       | Provide the mail address to filter mails by Recipient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3 | Subject         | Provide the value to filter mails by Subject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 4 | Category        | Provide the value to filter mails by Category.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 5 | Has Attachments | Provide the value to filter the emails with attachments. Allowed value: 'True' or 'False'.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 6 | Search Text     | Provide the value to search the text in either of Body, Sender, or Subject.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|   | Received date:  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 7 | Condition       | Select the condition to filter mail by received date. Allowed values are: 'None', 'Equal to', 'Smaller than', 'Greater than', 'Between...and...'. Date values below are not considered if Condition is 'None'/Blank.                                                                                                                                                                                                                                                                                                       |
| 8 | Date1           | Provide the Date1 (yyyy-MM-dd) for the provided condition.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 9 | Date2           | Provide the Date2 (yyyy-MM-dd) only if Between conditions is selected.<br><br><b>Note:</b> <ul style="list-style-type: none"> <li>• Validate Date1 and Date2 based on the selected condition for Received Date.</li> <li>• Date values below are not considered if Condition is 'None'/Blank.</li> <li>• Date1 value must be smaller than Date 2 value if Received Condition is 'Between...and...'; and if Date1 value is greater than Date 2 value then the workflow executes successfully without any output.</li> </ul> |

| Output Tab: |                   |                                                                                                                                                                                                                                  |

|   |                            | The data type is String. This field is mandatory.                                                                                  |
| 3 | Keep HTML Tags in the Body | Select the checkbox if you want the HTML tags to be displayed for the mail body.<br><b>Note:</b> The checkbox is clear by default. |

### 34.11 Office 365: Get Events

**Prerequisite:**

| Permission type                    | Permission (from least to most privileged)         |
|------------------------------------|----------------------------------------------------|
| Delegated (work or school account) | Calendars.Read, Calendars.ReadWrite offline_access |
| Application                        | Calendars.Read, Calendars.ReadWrite User.Read.All  |

#### 34.11.1 Description

Office 365: Get Events plugin step fetches the event’s information.

#### 34.11.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                               |
|-----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                        |
|     | Connection:                     |                                                                                                                                                                                                                           |
| 2   | Grant Type                      | Select the type of grant from Password Grant or Refresh Token or Client Credentials.<br><br>The data type is string. This field is mandatory.<br><br>Note: It is recommended to select the grant type from Refresh Token. |
| 3   | Tenant ID                       | Tenant ID of Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                                                                  |
| 4   | Client ID                       | Client ID of the Application created in Microsoft Account.<br><br>The data type is string. This field is mandatory.                                                                                                       |
|     | Client Secret:                  |                                                                                                                                                                                                                           |
| 5   | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list.                                                                                           |

|    |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                         | Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 6  | Client Secret           | <p>Specify the Client Secret generated in Microsoft Account.</p> <p>Client Secret is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Client Secret field appears as a Text box and accepts static or variable values. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.</p> <p>The data type is secure string. This field is mandatory.</p> |
| 7  | Username                | Specify the user name (user email address).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 8  | Password                | Specify the password for the provided user name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 9  | Refresh Token           | Specify the refresh token required to authenticate the details.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 10 | Button: Test Connection | <p>Test connection with Client ID and Client Secret provided. Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                      |

| Input Tab: |               |                                                                                                                                                                                                 |
|------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name    | Description                                                                                                                                                                                     |

## 34.12 Office 365: Move Email

### Prerequisite:

| Permission type | Permission (from least to most privileged) |
|-----------------|--------------------------------------------|
| Delegated       | Mail.Read, offline_access                  |

### 34.12.1 Description

Office 365: Move Email step moves the email from one folder to another.

### 34.12.2 Configurations

| No. | Field Name  | Description                                                                                                                           |
|-----|-------------|---------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow.                                                                    |
|     | Connection: |                                                                                                                                       |
| 2   | Grant Type  | Select the type of grant from Password Grant (Not Recommended) or Refresh Token.<br>The data type is string. This field is mandatory. |
| 2   | Tenant ID   | Tenant ID of Microsoft Account.<br><br>The data type is string. This field is mandatory.                                              |
| 3   | Client ID   | Client ID of the Application created in Microsoft Account.                                                                            |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|---|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                 | The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|   | Client Secret:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 4 | Accept Value as variable/static | Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.                                                                                                                                                                                                                                                                                                                                          |
| 5 | Client Secret                   | Specify the Client Secret generated in Microsoft Account.<br><br>Client Secret is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Client Secret field appears as a Text box and accepts static or variable values. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.<br><br>The data type is secure string. This field is mandatory. |
| 6 | Username                        | Specify the username for which email attachments are to be downloaded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 7 | Password                        | Specify the password for the specified username.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 8 | Refresh Token                   | Specify the refresh token to authenticate.<br><br><b>Note:</b> For MFA-enabled user account, select Grant Type as Refresh Token.                                                                                                                                                                                                                                                                                                                                                                                                             |
| 6 | Button: Test Connection         | Test connection with Client ID and Client Secret provided. Verifies whether the connection is established or not.<br><br><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                      |

|-----|---------------|-------------------------------------------------------------------------------------------------------------|
|     | Input Fields: |                                                                                                             |
| 1   | Message Id    | Specify the message Id of the email which is to be moved. The data type is string. This field is mandatory. |

|   |                    |                                                                                                                                                                                                                                                                                                                                     |
|---|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                    | <b>Note:</b> Message Id can be fetched using <a href="#">Office 365: Email Message Input</a> plugin step.                                                                                                                                                                                                                           |
| 2 | Destination Folder | Select the destination folder where emails are to be moved. Provide the destination folder path, such as folder1/folder2/folder3...folder n. The data type is string. This field is mandatory.<br><br><b>Note:</b> The Move Email plugin step may not work for the Destination Folder having special characters in the folder name. |
| 3 | Button: Get        | Click this button to display a windows pop-up with a list of the folders.                                                                                                                                                                                                                                                           |

### 34.13 Office 365: Remove License

**Compatibility:**

- Office 365 (Office 365 Business Premium License) and Microsoft Graph REST API v1.0

**Prerequisites:**

- The Microsoft Account should have the required O365 App Authentication and Permissions (Refer Appendix 5).  
Additionally, Office365 Remove License Step needs the following permissions.

| Permission Type | Permission Name (from least to most privileged) |
|-----------------|-------------------------------------------------|
| Application     | User.ReadWrite.All, Directory.ReadWrite.All     |

**References:**

<https://docs.microsoft.com/en-us/graph/api/user-assignlicense?view=graph-rest-1.0>

#### 34.13.1 Description

Office 365: Remove License plugin step removes a specified License from an Office 365 user.

**Note:**

- To generate the Tenant ID, Client ID, Client Secret, and provide permissions, see [Appendix: O365 App Registration, Authentication and Permissions in Azure](#).
- Product names and service plan identifiers for licensing. Click the following link to get the Subscription name or SKU ID (**GUID**): <https://learn.microsoft.com/en-us/azure/active-directory/enterprise-users/licensing-service-plan-reference>

### 34.13.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 2   | Tenant ID                       | Tenant ID of Microsoft Account.<br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|            | Input Fields:                |                                                   |
| 1          | Subscription Name (SKU Name) | Subscriptions that is available on the tenant.    |
| 2          | Button: Get                  | Displays list of all the available subscriptions. |
| 3          | User Email                   | Email address of the user.                        |
| 4          | Button: Get                  | Displays list of all the available user's emails. |

## 34.14 Office 365: Remove Member from Group

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

**Compatibility:**

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

**Prerequisites:**

- Tenant ID, Client ID and Client Secret should be known.
- The Microsoft Account should have the required O365 App Authentication and Permissions (Refer [Office 365 App Registration](#) ).

Additionally, Office365 Remove Member from Group Step needs the following permissions.

| Permission type | Permission (from least to most privileged)                              |
|-----------------|-------------------------------------------------------------------------|
| Application     | GroupMember.ReadWrite.All, Group.ReadWrite.All, Directory.ReadWrite.All |

|            | Input Fields:  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 1          | Group Email/ID | Specify the email address or Group ID of the group from which a user has to be removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 2          | Button: Get    | Click this button to display a windows pop-up with list of all the available group's emails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3          | User Email     | Email address of the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 4          | Button: Get    | <p>Click this button to display a windows pop-up with list of all the available User's Emails from the selected group.</p> <p>Can only fetch the top 100 User Emails on Get button.</p> <ol style="list-style-type: none"> <li>1. After successful execution, the removed member takes some time to get reflected on the instance.</li> <li>2. To remove member to security group use Group ID as the security group doesn't have an email address.</li> <li>3. We cannot remove members of Mail-Enabled Security Group through the plugin step.</li> </ol> |

## 34.15 Office 365: Reset Password

### Compatibility:

- Office 365(Office 365 Business Premium License) and Microsoft Graph REST API v1.0

**Prerequisites:**

- Tenant ID, Client ID and Client Secret should be known.
- The Microsoft Account should have the required O365 App Authentication and Permissions (Refer Office 365 App Registration ).
- To reset the password of user “Password Administrator” or “Helpdesk Administrator” permission from “Roles and administrators” should be given to the Application (O365 Azure AD). This permission may take some time to get reflected.
- Global administrator permission can reset the password for any user and all other administrators.
- Helpdesk administrators or Password administrators can reset passwords of other users who are non-administrators.

Additionally, Office365 Reset Password Step needs the following permissions.

| Permission type | Permission (from least to most privileged)                             |
|-----------------|------------------------------------------------------------------------|
| Application     | User.ReadWrite.All, Directory.ReadWrite.All, User.ManageIdentities.All |

**34.15.1 Description**

Office 365: Reset Password plugin step resets the password for a user in Office365.

**Important:** To use the step, you must add the registered app to the User Administrator role. Complete the following steps:

- i) Go to **Azure Active Directory**.
- ii) Select **Roles and administrators** → Search and click on **User administrator**.
- iii) Click on **Add assignments** button.
- iv) Go to **Select Member** → Click on **No member selected** button.
- v) Search your registered app name → Select that app.
- vi) Click on **next** button (you must have an active assignment) → Click on **Assign** button.

**34.15.2 Configurations**

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

#### 34.16.1 Description

Office 365: Send Email plugin step sends emails, with one or multiple attachments.

#### 34.16.2 Configurations

| No. | Field Name  | Description                                                        |
|-----|-------------|--------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|     | Connection: |                                                                    |

|    |                                 |                                                                                                                                                                                                                                                                                                                                                                    |
|----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2  | Grant Type                      | <p>Select the type of grant from Password Grant or Refresh Token.</p> <p>The data type is string. This field is mandatory.</p> <p>Note: It is recommended to select the grant type from Refresh Token.</p>                                                                                                                                                         |
| 3  | Tenant ID                       | <p>Tenant ID of Microsoft Account.</p> <p>The data type is string. This field is mandatory.</p>                                                                                                                                                                                                                                                                    |
| 4  | Client ID                       | <p>Client ID of the Application created in Microsoft Account.</p> <p>The data type is string. This field is mandatory.</p>                                                                                                                                                                                                                                         |
|    | Client Secret:                  |                                                                                                                                                                                                                                                                                                                                                                    |
| 5  | Accept Value as variable/static | <p>Leave checkbox unchecked to accept Client Secret value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Client Secret field to appear as Text box.</p>                                                                                                                                                         |
| 6  | Client Secret                   | <p>Specify the Client Secret generated in Microsoft Account. The data type is secure string. This field is mandatory.</p> <p>If checkbox above is enabled Client Secret field appears as a Text box and accepts static or variable values. Else if checkbox above is disabled Client Secret field appears as a drop down to select fields from previous steps.</p> |
| 7  | Username                        | <p>Specify the Username for sending emails.</p>                                                                                                                                                                                                                                                                                                                    |
|    | Password:                       |                                                                                                                                                                                                                                                                                                                                                                    |
| 8  | Accept Value as variable/static | <p>Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.</p>                                                                                                                                                                   |
| 9  | Password                        | <p>Specify the Password for provided Username.</p> <p>If checkbox above is enabled Password field appears as a Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> <p>The data type is secure string. This field is mandatory.</p>                  |
| 10 | Button: Test Connection         | <p>Test connection with Client ID and Client Secret provided. Verifies whether the connection is established or not.</p> <p><b>Note:</b> For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>     |

| General Tab: |                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.          | Field Name                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|              | Destination Addresses:              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1            | To                                  | Provide a semicolon (;) separated list of email addresses to send mail.<br>The data type is string. This field is optional.<br>At least a value in any one of To, Cc or Bcc is mandatory.                                                                                                                                                                                                                                                                                                                        |
| 2            | Cc                                  | Provide a semicolon (;) separated list of email addresses to send email as carbon copy (Cc).<br>The data type is string. This field is optional.<br>At least a value in any one of To, Cc or Bcc is mandatory.                                                                                                                                                                                                                                                                                                   |
| 3            | Bcc                                 | Provide a semicolon (;) separated list of email addresses to send email as Blind carbon copy (Bcc).<br>The data type is string. This field is optional.<br>At least a value in any one of To, Cc or Bcc is mandatory.                                                                                                                                                                                                                                                                                            |
| 4            | Message:                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 4.a          | Subject                             | Specify the subject of the email.<br>The data type is string. This field is optional.<br>At least a value in any one of Subject or Body is mandatory.                                                                                                                                                                                                                                                                                                                                                            |
| 4.b          | Body                                | Specify the Body of email. A value in any one of Subject or Body is mandatory.<br>The data type is string. This field is optional.<br><br><b>Note:</b><br>HTML support is provided. However, due to security purposes, it is not recommended to provide the entire HTML body using the environment variable. You can form an HTML body using either Modified Java Script or using an HTML email template. The environment variables or fields can be used at the places of dynamic values in the email template. |
| 4.c          | Save Draft Email In Case Of Failure | Provide valid input for Saving the draft message. Allowed values are 'Yes' and 'No'.<br>The default value is No.                                                                                                                                                                                                                                                                                                                                                                                                 |

| 2 | Attachment OR Paths of Attachments (JSON) | <p>Provide file path to send a single file as an attachment or provide the JSON containing multiple entries of paths of attachments. You may type the JSON or fetch the JSON text from an environment variable or a previous field in the stream.</p> <p>The data type is string. If Yes is specified provide a JSON file with a list of attachments; If No is specified above, then provide an Attachment file path or leave this blank; else If the field above is blank i.e. no attachments leave this field blank.</p> <p>Sample JSON with path of Multiple Attachments:</p> <p>a) Sample JSON for multiple attachments JSON using double slash:</p> <pre data-bbox="654 720 1170 982"> {   "attachments": [     {       "filePath": "D:\\Folder\\abc.txt"     },     {       "filePath": "D:\\Folder\\Capture.JPG"     }   ] } </pre> <p>b) Sample JSON for Multiple Attachments JSON using forward slash:</p> <pre data-bbox="654 1161 1141 1423"> {   "attachments": [     {       "filePath": "D:/Folder/abc.txt"     },     {       "filePath": "D:/Folder/Capture.JPG"     }   ] } </pre> |
| 3 | Browse                                    | <p>Browse a single Attachment file.</p> <p>The data type is string. This field is optional.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 35 OneDrive

### Prerequisites:

- Azure AD instance with access details.
- Appropriate user (Delegated) permissions. For more information, refer Microsoft Documentation as mentioned in references below.

## References:

- For information on application setup and refresh token refer Microsoft documentation link <https://docs.microsoft.com/en-us/azure/active-directory/develop/quickstart-register-app#register-an-application>

## Refresh Token for connection to OneDrive

In One Drive Plugin Connection Configuration we need to provide connectivity details for a - OneDrive instance as mentioned in the table below.

Connection Details:

| No. | Field Name      | Datatype | Mandatory? | Description                                                                     |
|-----|-----------------|----------|------------|---------------------------------------------------------------------------------|
| 1.  | Client ID       | String   | --         | Client ID provided by Azure Active Directory.                                   |
| 2   | Refresh Token   | String   | Yes        | Refresh Token provided by authorization grant flow discussed in sections below. |
| 3   | Test Connection | Button   | --         | Verifies whether the connection is established or not.                          |

Following are the steps for generating refresh token for OneDrive plugins,

- Register app for OneDrive on Azure AD, refer [Appendix 12: OneDrive Refresh Token: Register app for OneDrive on Azure AD.](#)
- Generate Refresh Token for OneDrive, refer [Appendix 12: OneDrive Refresh Token: Generate Refresh Token OneDrive.](#)

## Get OneDrive Folder or File - Path

Folder or File – Path/ID is required in most OneDrive Plugin steps. Refer [Appendix 13: OneDrive Folder/File Path](#) to get path.

## 35.1 Copy File or Folder

### 35.1.1 Description

OneDrive: Copy File plugin step copies a file or folder in OneDrive.

#### Note:

- Support is provided for the Personal Drive, however, the displayed error message is not correct.
- When Rename value and non-existing Destination Folder Path is provided and Create Folder is No, then this step will execute successfully and rename the source item.

- When non-existing Destination Folder Path is provided, Create Folder is No and Rename value is not provided, then this step will abort with error 'The specified item name already exists.'.

**Prerequisite Permissions:**

For Copy File or Folder step in OneDrive following are the permissions needed.

| Permission type                        | Permission (from least to most privileged) |
|----------------------------------------|--------------------------------------------|
| Delegated (work or school account)     | Files.ReadWrite, Files.ReadWrite.All       |
| Delegated (personal Microsoft account) | Files.ReadWrite, Files.ReadWrite.All       |

|------------|------------|-------------|
| No.        | Field Name | Description |

| Input Fields: |                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1             | Source File Or Folder ID/Path           | Provide OneDrive source file or folder id or path to copy file or folder in destination.<br>The field data type is String. This is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2             | Destination Folder ID/Path              | Specify the OneDrive folder id or path to copy file or folder.<br>The field data type is String. This is mandatory.<br><br>To specify OneDrive Path:<br><br>For example, OneDrive path == <a href="https://organization-my.sharepoint.com/personal/xyz/Documents/demofolder/File.xlsx">https://organization-my.sharepoint.com/personal/xyz/Documents/demofolder/File.xlsx</a><br><br>Provide == demofolder/File.xlsx<br><br>To specify OneDrive Path to create folder:<br><br>For example, OneDrive path == <a href="https://organization-my.sharepoint.com/personal/xyz/Documents/abc">https://organization-my.sharepoint.com/personal/xyz/Documents/abc</a><br><br>To create root folder == Documents/newfolder<br><br>To create inner folder == abc/newfolder |
| 3             | File Or Folder Name After Copy (Rename) | Specify the name to rename the file or folder in destination location. The field data type is String.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 4             | Create Folder(if not exists)            | Specify the allowed values to perform the action of creating folder. Allowed values are: Yes/No.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Known Issues

Sometimes, you may see a temporary error related to the internet connectivity and network issues. The issue arises when the hostname is unresolved and the local server does not receive a response from an authoritative server. For example, you may see any of the following messages:

- login.microsoftonline.com.

OR

- This is usually a temporary error during hostname resolution and means that the local server did not receive a response from an authoritative server (login.microsoftonline.com)

## 35.2 Create Folder

### 35.2.1 Description

One Drive: Create Folder plugin step creates a folder on OneDrive.

#### Note:

- Support is provided for the Personal Drive, however, the displayed error message is not correct.

#### Prerequisite Permissions:

For Create Folder step in OneDrive following are the permissions needed.

| Permission type                        | Permission (from least to most privileged) |
|----------------------------------------|--------------------------------------------|
| Delegated (work or school account)     | Files.ReadWrite, Files.ReadWrite.All       |
| Delegated (personal Microsoft account) | Files.ReadWrite, Files.ReadWrite.All       |

|            | Input Fields:     |                                                                                                                                         |
| 1          | File Overwritten? | Provide output field name to hold the value for file overwritten (Yes/No). Default is 'FileOverwritten'. The field data type is String. |

## 35.5 Move File Or Folder

### 35.5.1 Description

One Drive: Move File or Folder step moves a file or folder in OneDrive.

**Note:**

- Support is provided for the Personal Drive, however, the displayed error message is not correct.
- When Rename value and non-existing Destination Folder Path is provided and Create Folder is No, then this step will execute successfully and rename the source item.

**Prerequisite Permissions:**

For Move File Or Folder step in OneDrive following are the permissions needed.

| Permission type                        | Permission (from least to most privileged) |
|----------------------------------------|--------------------------------------------|
| Delegated (work or school account)     | Files.ReadWrite, Files.ReadWrite.All       |
| Delegated (personal Microsoft account) | Files.ReadWrite, Files.ReadWrite.All       |

### 35.5.2 Configurations

| Configuration: |             |                                                                          |
|----------------|-------------|--------------------------------------------------------------------------|
| No.            | Field Name  | Description                                                              |
| 1              | Step Name   | Name of the step. This name has to be unique in a single workflow.       |
|                | Connection: |                                                                          |
| 2              | Client ID   | Select the client ID for which you want to list the drive item contents. |

|   |                                           |                                                                                                                                                                                                                                              |
|---|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                           | <p>For connecting with OneDrive, refer connection documentation.</p> <p>Note: This field is mandatory for personal accounts.</p>                                                                                                             |
| 3 | Checkbox: Accept value as variable/static | <p>Leave checkbox unchecked to accept Refresh Token* value from a field - in the previous steps of the stream using a drop down list.</p> <p>Else enable checkbox for Refresh Token* field to appear as Text box.</p>                        |
| 4 | Refresh Token                             | <p>Specify the Refresh Token provided by authorization grant flow.</p> <p>Generate and specify Refresh Token as detailed in <a href="#">Appendix 1: OneDrive Refresh Token</a>.</p> <p>The data type is String. This field is mandatory.</p> |
| 5 | Button: Test Connection                   | <p>Verifies whether the connection is established or not.</p>                                                                                                                                                                                |

| Input Tab: |                               |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                     |
|            | Input Fields:                 |                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1          | Source File Or Folder ID/Path | <p>Provide OneDrive source file or folder path or id to move file or folder in destination.</p> <p>The data type is String. This field is mandatory.</p>                                                                                                                                                                                                                                                                        |
| 2          | Destination Folder ID/Path    | <p>Specify the OneDrive folder path or id to move file or folder.</p> <p>The data type is String. This field is mandatory.</p> <p>To specify OneDrive Path:</p> <p>For example, OneDrive path == <a href="https://organization-my.sharepoint.com/personal/xyz/Documents/demofolder/File.xlsx">https://organization-my.sharepoint.com/personal/xyz/Documents/demofolder/File.xlsx</a></p> <p>Provide == demofolder/File.xlsx</p> |
| 3          | Create Folder(if not exists)  | <p>Specify the allowed values to perform the action.</p> <p>Default value: Yes/No.</p> <p>The data type is String.</p> <p>To specify OneDrive Path to create folder:</p> <p>For example, OneDrive path == <a href="https://organization-my.sharepoint.com/personal/xyz/Documents/abc">https://organization-my.sharepoint.com/personal/xyz/Documents/abc</a></p>                                                                 |

|   |                                           |                                                                                                 |
|---|-------------------------------------------|-------------------------------------------------------------------------------------------------|
|   |                                           | To create root folder == Documents/newfolder<br>To create inner folder == abc/newfolder         |
| 4 | File Or Folder Name After Move (Rename)   | Specify the name to rename the file or folder in destination location. The data type is String. |
| 5 | If File Or Folder Exists On OneDrive Path | Specify from allowed values: AutoRename, Overwrite, ThrowException The data type is String.     |

| Output Tab: |                            |                                                                            |
|-------------|----------------------------|----------------------------------------------------------------------------|
| No.         | Field Name                 | Description                                                                |
|             | Output Fields              |                                                                            |
| 1           | Output File Or Folder ID   | Provide output field name.<br>Default value: <i>OutputFileOrFolderID</i>   |
| 2           | Output File Or Folder Path | Provide output field name.<br>Default value: <i>OutputFileOrFolderPath</i> |

### Known Issues

Sometimes, you may see a temporary error related to the internet connectivity and network issues. The issue arises when the hostname is unresolved and the local server does not receive a response from an authoritative server. For example, you may see any of the following messages:

- login.microsoftonline.com.

OR

- This is usually a temporary error during hostname resolution and means that the local server did not receive a response from an authoritative server (login.microsoftonline.com)

## 35.6 Rename File Or Folder

### Permissions:

Rename File Or Folder step in OneDrive following are the permissions needed.

| Permission type | Permission (from least to most privileged) |
|-----------------|--------------------------------------------|
|                 |                                            |

|                                        |                                      |
|----------------------------------------|--------------------------------------|
| Delegated (work or school account)     | Files.ReadWrite, Files.ReadWrite.All |
| Delegated (personal Microsoft account) | Files.ReadWrite, Files.ReadWrite.All |

|-------------|-------------------|-----------------------------------------------------------------------|
| No.         | Field Name        | Description                                                           |
|             | Output Field:     |                                                                       |
| 1           | Renamed Item Name | <p>Specify the output field name. Default: <i>RenamedItemName</i></p> |

### Known Issues

Sometimes, you may see a temporary error related to the internet connectivity and network issues. The issue arises when the hostname is unresolved and the local server does not receive a response from an authoritative server. For example, you may see any of the following messages:

- login.microsoftonline.com.

OR

- This is usually a temporary error during hostname resolution and means that the local server did not receive a response from an authoritative server (login.microsoftonline.com)

## 35.7 Upload File

### Prerequisite Permissions:

For Upload File step on OneDrive the following Microsoft Graph permissions are required.

| Permission type                        | Permission (from least to most privileged) |
|----------------------------------------|--------------------------------------------|
| Delegated (work or school account)     | Files.ReadWrite, Files.ReadWrite.All       |
| Delegated (personal Microsoft account) | Files.ReadWrite, Files.ReadWrite.All       |

### 35.7.1 Description

One Drive: Upload File Step uploads a file on OneDrive.

**Note:** Support is provided for the Personal Drive, however, the displayed error message is not correct.

### 35.7.2 Configurations

| Configuration: |                                           |                                                                                                                                                                                                                                                                                          |
|----------------|-------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                                | Description                                                                                                                                                                                                                                                                              |
| 1              | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                       |
|                | Connection:                               |                                                                                                                                                                                                                                                                                          |
| 2              | Client ID                                 | Select the client ID for which you want to download a file. For connecting with OneDrive, refer <a href="#">Appendix 1: OneDrive Refresh Token</a> .<br><br><b>Note:</b> This field is mandatory for personal accounts.                                                                  |
| 3              | Checkbox: Accept value as variable/static | Leave checkbox unchecked to accept Refresh Token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Refresh Token field to appear as Text box.                                                                                      |
| 4              | Refresh Token                             | Generate and specify Refresh Token as detailed in <a href="#">Appendix 1: OneDrive Refresh Token</a> .<br>The data type is String. This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box (enter static value or environment variable). Else if |

|   |                         |                                                                                                        |
|---|-------------------------|--------------------------------------------------------------------------------------------------------|
|   |                         | checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
| 5 | Button: Test Connection | Verifies whether the connection is established or not.                                                 |

| Input Tab: |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 1           | Uploaded File ID | Specify a fieldname to hold the output - uploaded file id.<br>Default is UploadedFileID. The data type is String. |

## 36 Oracle

This plugin is designed to execute various operations on Oracle database.

This plugin has been tested with Oracle 12c on Windows OS.

### Prerequisites:

1. Oracle 12c environment on Windows.
2. Sufficient privileges for operation to be done (preferably sysbda privileges/Dbu user).
3. The pluggable database (PDB) should be open before performing any action on PDB.
4. **ojdbc6.jar** must be present in lib folder of Process Studio as well as AE agent.
5. For connecting to the Oracle Server, **OracleOraDB12homeTNSListener** & **OracleServiceSID** should be started

### 36.1 Create User

#### 36.1.1 Description

This plugin is used to create a new oracle user.

#### Prerequisites:

© 2023 AutomationEdge Inc All Rights Reserved.  
This document is for your company's internal use only and may not be distributed to any third party.

1. Oracle 11g/12c environment on Windows
2. Oracle 12c environment on Linux.
3. Sufficient privileges to create the tablespace(preferably sysdba privileges).
4. **ojdbc6.jar** must be present in lib folder of Process Studio as well as AE agent.
5. While testing on Oracle 12c Windows/Linux the pluggable database should be open before performing any action.
6. For connecting to the Oracle Server, **OracleOraDB12homeTNSListener & OracleServiceORCL** should be started

Limitations:

On Oracle 12C database the plugin works for only CDB (Container Database). It does not work for PDB (Pluggable Database).

### 36.1.2 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                  |

| 1   | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                           |
|     | Connection:               |                                                                                                                                                                                                                                                                                                              |
| 2   | Server Name/IP            | The IP or fully qualified domain name of the Oracle database machine. This field is mandatory.                                                                                                                                                                                                               |
| 3   | Port Number               | The port number of the Oracle database. Port number should be a positive integer. This field is mandatory.                                                                                                                                                                                                   |
| 4   | SID/ Service name         | Unique database name or service name. This field is mandatory.                                                                                                                                                                                                                                               |
| 5   | Username                  | The username having permission to create new User (Ex: - sysdba). This field is mandatory.                                                                                                                                                                                                                   |
|     | Password:                 |                                                                                                                                                                                                                                                                                                              |
| 6   | Accept Values from fields | Enable this checkbox to accept Password value from a field in the previous steps of the stream using a drop down list.                                                                                                                                                                                       |
| 7   | Password                  | The password for the Oracle username to authenticate. This field is mandatory.<br><br>Password is entered using a widget called SecuredComboVar. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory. |

|   |                 |                                                                                                                                                                                                                              |
|---|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | If checkbox above is enabled Password field appears as Text Var. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.                                              |
|   | Button:         |                                                                                                                                                                                                                              |
| 8 | Test Connection | Verifies whether the connection is established or not.<br><br><b>NOTE:</b> Test Connection button does not work for previous step variables. Test Connection button only works with static values and environment variables. |

| Input Tab: |               |                                                                   |
|------------|---------------|-------------------------------------------------------------------|
| No.        | Field Name    | Description                                                       |

| 1           | Result         | Output field to hold the result of the successful plugin execution |

## 36.2 Delete User

### 36.2.1 Description

The step is used to delete oracle user specified.

#### Limitations:

On Oracle 12C database the plugin works for only CDB (Container Database). It does not work for PDB (Pluggable Database).

### 36.2.2 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 36.3 Create Tablespace

### 36.3.1 Description

This plugin is designed to create a Tablespace into Oracle Database installed on Windows Server and Linux Server OS. The Tablespace is created based on the below input criteria provided by the user.

1. SID/Service name of the Oracle Database.
2. Type of Tablespace.
3. Name of Tablespace.
4. Name and Size of Datafile.

#### Prerequisites

1. Oracle 11g/12c environment on Windows
2. Oracle 12c environment on Linux.
3. Sufficient privileges to create the tablespace (preferably sysdba privileges).
4. **ojdbc6.jar** must be present in lib folder of Process Studio as well as AE agent.
5. While testing on Oracle 12c Windows/Linux the pluggable database should be open before performing any action.

6. For connecting to the Oracle Server, **OracleOraDB12homeTNSListener & OracleServiceORCL** should be started

### 36.3.2 Configurations

| No. | Field Name                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|     | Connection:               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 2   | Server Name/IP            | The IP or fully qualified domain name of the Oracle database machine. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Port Number               | The port number of the Oracle database. Port number should only be a positive integer. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                            |
| 4   | SID/ Service name         | The SID/Service name of the Oracle database that uniquely identifies the database instance. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                       |
| 5   | Username                  | The username of user having permission to create new Tablespace (Ex:- sysdba). This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                    |
|     | Password:                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6   | Accept Values from fields | Enable this checkbox to accept Password value from a field in the previous steps of the stream using a drop down list.                                                                                                                                                                                                                                                                                                                                                                                     |
| 7   | Password                  | <p>The password for the Oracle username to authenticate. This field is mandatory.</p> <p>Password is entered using a widget called SecuredComboVar. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var. ## 36.4 Extend Tablespace

### 36.4.1 Description

This plugin is designed to extend a Tablespace by adding datafile or tempfile into Oracle Database located on Windows Server. The Tablespace is created based on the below input criteria provided by the user.

1. SID/Service name of the Oracle Database.
2. Name of Tablespace.
3. Name and Size of Datafile.
4. AutoExtend

Prerequisites:

1. Oracle 11g/12c environment on Windows
2. Oracle 12c environment on Linux.
3. Sufficient privileges to create the tablespace (preferably sysdba privileges).
4. **ojdbc6.jar** must be present in lib folder of Process Studio as well as AE agent.
5. While testing on Oracle 12c Windows/Linux the pluggable database should be open before performing any action.
6. For connecting to the Oracle Server, **OracleOraDB12homeTNSListener & OracleServiceORCL** should be started

### 36.4.2 Configurations

| No. | Field Name        | Description                                                                                                    |
|-----|-------------------|----------------------------------------------------------------------------------------------------------------|
| 1   | Step Name         | Name of the step. This name has to be unique in a single workflow.                                             |
|     | Connection:       |                                                                                                                |
|     | Server Name/IP    | The server name/IP of the Oracle database. Server Name is mandatory.                                           |
| 3   | Port Number       | The port number of the Oracle database. Port number should only be positive integer. Port Number is mandatory. |
| 4   | SID/ Service name | The SID of the Oracle database that uniquely identifies the database instance. SID is mandatory.               |
| 5   | Username          | The username having permission to create new Tablespace (Ex:- sysdba). Username is mandatory.                  |

|   |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Password:                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 6 | Accept Values from fields | Enable this checkbox to accept Password value from a field in the previous steps of the stream using a drop down list.                                                                                                                                                                                                                                                                                                                                                                                     |
| 7 | Password                  | <p>The password for the Oracle username to authenticate. This field is mandatory.</p> <p>Password is entered using a widget called SecuredComboVar. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text Var. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |
|   | Button:                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 8 | Test Connection           | <p>Verifies whether the connection is established or not.</p> <p><b>NOTE:</b> Test Connection button does not work for previous step variables. Test Connection button only works with static values and environment variables.</p>                                                                                                                                                                                                                                                                        |

| Input Tab: |                    |                                                                                                                                                                                                                                                                               |
|------------|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name         | Description                                                                                                                                                                                                                                                                   |
|            | Input Fields:      |                                                                                                                                                                                                                                                                               |
| 1          | Tablespace Name    | The unique datafile name. Tablespace Name is mandatory.                                                                                                                                                                                                                       |
| 2          | Datafile Name      | The size of datafile greater than Zero (0M). It is not required to mention the extensions of datafile in the plugin. It will be handled internally depend upon the type of tablespaces. Datafile size should not be Lesser than or equal to Zero. Datafile Name is mandatory. |
| 3          | Datafile Size      | Size of datafile automatically extends if Autoextend for datafile if set to 'ON' in the database. In this plugin Datafile size should not be Lesser than or equal to Zero. The size of datafile should be greater than Zero (0). Datafile Size is mandatory.                  |
| 4          | Size Unit(K/M/G/T) | A size unit such K, M, G or T should be provided in the Size Unit field for the Datafile size chosen above. This is visible in a tool tip as well. This field is mandatory.                                                                                                   |

|   |            |                                                                                                                                                          |
|---|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | AutoExtend | Automatically extends the size of datafile if set to 'ON'. It should be entered as On or Off.<br>This is visible in a tool tip. AutoExtend is mandatory. |
|---|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|

| 1   | OK         | On click of this button. It will check the field values. If any required field values are missing then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2   | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                             |

## 36.5 Reset User Password

### 36.5.1 Description

This step resets the password of Oracle user on the given Oracle database.

Limitations:

On Oracle 12C database the plugin works for only CDB (Container Database) and not for PDB (Pluggable Database).

### 36.5.2 Configurations

| No. | Field Name  | Description                                                        |
|-----|-------------|--------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|     | Connection: |                                                                    |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Server Name/IP                            | The Hostname/serve name/IP of the Oracle database. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                             |
| 3 | Port Number                               | The port number of the Oracle database. Port number should be a positive integer. This field is mandatory.                                                                                                                                                                                                                                                                                                                                              |
| 4 | SID/ Service name                         | Unique database name or service name.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5 | Username                                  | The username having permission to Delete User (Ex:- sysdba). This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                   |
|   | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 6 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                               |
| 7 | Password                                  | The Password to the username to authenticate to Oracle database. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|   | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 8 | Test Connection                           | Verifies whether the connection is established or not.                                                                                                                                                                                                                                                                                                                                                                                                  |

**NOTE:** Test Connection button does not work for previous step variables. Test Connection button only works with static values and environment variables.

| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                      |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 2   | Server Name/IP                            | The Hostname/serve name/IP of the Oracle database. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Port Number                               | The port number of the Oracle database. Port number should be a positive integer. This field is mandatory.                                                                                                                                                                                                                                                                                                                                              |
| 4   | SID/ Service name                         | Unique database name or service name.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 5   | Username                                  | The username having permission to Delete User (Ex:- sysdba). This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                   |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 6   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                               |
| 7   | Password                                  | The Password to the username to authenticate to Oracle database. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 8   | Test Connection                           | Verifies whether the connection is established or not.                                                                                                                                                                                                                                                                                                                                                                                                  |

**NOTE:** Test Connection button does not work for previous step variables. Test Connection button only works with static values and environment variables.

| Input Tab: |                    |                                                                                   |

| 1           | Result         | Output field to hold the result of the successful plugin execution. |

## 37 OTRS

### Prerequisite:

- Provide access (whitelist) to the **Server Address** URL through your firewall and network.
- User must have OTRS server and login details, that is, the Username and Password to authenticate.

### 37.1 OTRS: Create Ticket

#### 37.1.1 Description

OTRS: Create Ticket plugin step creates a ticket in OTRS.

#### 37.1.2 Reference

<https://doc.otrs.com/doc/api/otrs/8.0/Perl/Kernel/GenericInterface/Operation/Ticket/TicketCreate.pm.html>

#### 37.1.3 Configurations

| No. | Field Name     | Description                                                                                      |
|-----|----------------|--------------------------------------------------------------------------------------------------|
| 1   | Step Name      | Name of the step. This name has to be unique in a single workflow.                               |
|     | Connection:    |                                                                                                  |
| 2   | Server Address | Specify the address of the OTRS server. For example, http://13.41.4.56. This field is mandatory. |
| 3   | UserName       | Click the button to select the user name of the agent. This field is mandatory.                  |

|   |                 |                                                                                                                                                                                                                |
|---|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Password        | Specify the password for the agent. This field is mandatory.                                                                                                                                                   |
|   | Button:         |                                                                                                                                                                                                                |
| 5 | Test Connection | Verifies whether the connection is established or not.<br>NOTE: Test Connection button does not work for previous step fields. Test Connection button only works with static values and environment variables. |

| Input Tab: |                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| No.        | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | Input Fields:                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1          | Input PDF Path                            | Specify the file path of the PDF file to be converted to the image.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 2          | Button: Browse...                         | Clicking on this button brings up the dialog to browse the PDF file which is to be converted to specified image format.                                                                                                                                                                                                                                                                                                                                                                           |
|            | PDF Password:                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3          | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept PDF Password from a field in the previous steps using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                         |
| 4          | Password                                  | Provide PDF password if the pdf is password protected. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is optional.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |

|   |                     |                                                                                                                                                                                 |
|---|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                     | If the pdf is not password protected and a password is provided it is ignored.                                                                                                  |
| 5 | Pages               | Page numbers of the pdf that are to be converted to the provided image format. This can be given as a comma separated integer value or range of page numbers (e.g. 1,2,4,10-15) |
| 6 | Output Image Format | Format of the output image. Allowed values are 'JPG', 'PNG', 'JPEG', 'BNP'                                                                                                      |
| 7 | Resolution in DPI   | Resolution in DPI for the output image to be downloaded. Resolution in DPI should be a positive integer and should not exceed 1200.                                             |
| 8 | Output Folder Path  | Specify the path of the folder where images for each page in the pdf are to be downloaded.                                                                                      |
| 9 | Button: Browse...   | Clicking on this button brings up the dialog to browse the path of the output folder.                                                                                           |

Output Tab:

| No. | Field Name          | Description                                                                                                                                                                    |
|-----|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Output Fields:      |                                                                                                                                                                                |
| 1   | Number of Pages     | Specify an output field to hold the number of PDF pages converted to image on successful plugin execution                                                                      |
| 2   | Non-available Pages | Specify an output field to hold the page numbers of non-available PDF pages on successful plugin execution (page numbers will be displayed in comma separated integer values). |
| 3   | Error Pages         | Specify an output field to hold the page numbers of erroneous PDF pages on successful plugin execution (page numbers will be displayed in comma separated integer values).     |

Common Buttons:

| No. | Field Name | Description                                                                                                                                                                                                                                |

|            | Input Fields:  |                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 1          | Input PDF Path | Specify full file path of the PDF file to be split.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                                                                                                                     |
| 2          | Browse...      | Click to browse the PDF file which is to be split.                                                                                                                                                                                                                                                                                                                                                                           |
| 3          | PDF Password   | Provide PDF password if the pdf is password protected.<br>Password is encrypted and not stored in the workflow(.psw) file.<br><br>If checkbox above is enabled Password field appears as Text box and you may provide a static value or variable.<br>Else if checkbox above is disabled Password field appears as a drop down containing fields from previous steps. You may select the field containing the password value. |

|   |                       |                                                                                                                                                    |
|---|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                       | If the pdf is not password protected and a password is provided it is ignored.                                                                     |
| 4 | Start Page            | Specify the page number starting which the PDF is to be split. Start Page is a positive integer.                                                   |
| 5 | End Page              | Specify the page number up to which the PDF is supposed to be split. End Page is a positive integer.                                               |
| 6 | Split At Every X Page | The number specifies where to split the pages i.e., this will split the document after every X pages. Split At Every X Page is a positive integer. |
| 7 | Output Folder Path    | Specify the Path of the folder where split PDFs are to be downloaded. The data type is String. This field is mandatory.                            |
| 8 | Browse...             | Click button to browse the path of the output folder.                                                                                              |

|     | Buttons:   |                                                                                                                                                                                                                                            |
| 1   | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2   | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

## 39 Salesforce (REST)

**Prerequisites:**

- To get the Refresh Token, give Auth Scope (permission), **Perform requests at any time(refresh\_token, offline\_access)**, from the Salesforce instance.
- To get access to the Salesforce API, give **Manage user data via APIs(API)** permission.
- Provide access (whitelist) to the following URLs through your firewall and network.

**https://{domainName}.my.salesforce.com**

- Check the **SalesforceREST\_TokenGeneration** document to create connected apps and refresh token.

### 39.1.2 Configurations

| No. | Field Name                    | Description                                                                                                                                                                        |
|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                     | Name of the step. This name has to be unique in a single workflow.                                                                                                                 |
|     | Connection:                   |                                                                                                                                                                                    |
| 1   | Instance URL                  | Specify the instance URL of Salesforce instance. This field is mandatory.                                                                                                          |
| 2   | Consumer Key/Client ID        | Specify the connected app's consumer key which is found on the connected app's Manage Connected Apps page or from the connected app's definition. This field is mandatory.         |
| 3   | Consumer Secret/Client Secret | Specify the connected app's consumer secret, which can be found on the connected app's Manage Connected Apps page or from the connected app's definition. This field is mandatory. |
| 4   | Refresh Token                 | Specify a Refresh Token to obtain a new Access Token. This field is mandatory.                                                                                                     |
| 5   | Test Connection               | Click to verify whether the connection is established or not.                                                                                                                      |

|  |  |                                                                                                                                                                 |
|--|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | <p><b>Note:</b><br/>Test Connection will only work with static (hardcoded) values and environment variables. It will not work for the previous step fields.</p> |

### 39.2.2 Configurations

| No. | Field Name                    | Description                                                                                                                                                                        |
|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                     | Name of the step. This name has to be unique in a single workflow.                                                                                                                 |
|     | Connection:                   |                                                                                                                                                                                    |
| 1   | Instance URL                  | Specify the instance URL of Salesforce instance. This field is mandatory.                                                                                                          |
| 2   | Consumer Key/Client ID        | Specify the connected app's consumer key which is found on the connected app's Manage Connected Apps page or from the connected app's definition. This field is mandatory.         |
| 3   | Consumer Secret/Client Secret | Specify the connected app's consumer secret, which can be found on the connected app's Manage Connected Apps page or from the connected app's definition. This field is mandatory. |
| 4   | Refresh Token                 | Specify a Refresh Token to obtain a new Access Token. This field is mandatory.                                                                                                     |
| 5   | Test Connection               | Click to verify whether the connection is established or not.                                                                                                                      |

|  |  |                                                                                                                                                                 |
|--|--|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | <p><b>Note:</b><br/>Test Connection will only work with static (hardcoded) values and environment variables. It will not work for the previous step fields.</p> |

**39.3.2 Configurations**

| No. | Field Name                    | Description                                                                                                                                                                                                                  |
|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                     | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                           |
|     | Connection:                   |                                                                                                                                                                                                                              |
| 1   | Instance URL                  | Specify the instance URL of Salesforce instance. This field is mandatory.                                                                                                                                                    |
| 2   | Consumer Key/Client ID        | Specify the connected app’s consumer key which is found on the connected app’s Manage Connected Apps page or from the connected app’s definition. This field is mandatory.                                                   |
| 3   | Consumer Secret/Client Secret | Specify the connected app’s consumer secret, which can be found on the connected app’s Manage Connected Apps page or from the connected app’s definition. This field is mandatory.                                           |
| 4   | Refresh Token                 | Specify a Refresh Token to obtain a new Access Token. This field is mandatory.                                                                                                                                               |
| 5   | Test Connection               | Click to verify whether the connection is established or not.<br><br><b>Note:</b><br>Test Connection will only work with static (hardcoded) values and environment variables. It will not work for the previous step fields. |

| Input Tab: |               |                                                                                                                                                                                                                                                                         |
|------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name    | Description                                                                                                                                                                                                                                                             |
|            | Input Fields: |                                                                                                                                                                                                                                                                         |
| 1          | Specify Query | Select this check box to manually execute a query based on SOQL statements. By default, the checkbox is clear.<br><br><b>Note:</b> The SOQL Query field appears only if the checkbox is selected. Else, you need to enter details in Module and Query Condition fields. |
| 2          | Module        | Select the module (table) from which you want to retrieve data.                                                                                                                                                                                                         |

|   |                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Get               | <p>Click to populate the list of module names on the Salesforce instance.</p> <p><b>Note:</b> The list is populated if the connection is successfully established.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 4 | Query Condition   | <p>Enter any query filters you want to apply. Variables are allowed.</p> <p><b>Query Condition</b></p> <p><b>Syntax:</b> <code>&lt;&lt;fieldName&gt;&gt;='&lt;&lt;fieldValue&gt;&gt;'</code></p> <p><b>Example:</b> <code>Subject='Rpaticket'</code></p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• Users do not need to include <b>WHERE</b> in the <b>Query Condition</b> statement.</li> <li>• The output response does not display deleted records. However, if you want to view the deleted records use the following flag:</li> </ul> <p><b>For example:</b></p> <p><code>Subject='Rest1' AND isDeleted=true</code></p>                                                                                                                                                                                                       |
| 5 | SOQL Query        | <p>Use the Salesforce Object Query Language (SOQL) to search Salesforce data for specific information.</p> <p><b>Syntax:</b> <code>SELECT &lt;&lt;fieldName&gt;&gt; FROM &lt;&lt;moduleName&gt;&gt; WHERE &lt;&lt;fieldName&gt;&gt;='&lt;&lt;fieldValue&gt;&gt;'</code></p> <p><b>Example:</b> <code>SELECT IncidentNumber FROM Incident WHERE Subject='Rpaticket'</code></p> <p><b>Note:</b></p> <p>To fetch/omit deleted records in the output response, use <b>isDeleted</b>.</p> <p>For example:</p> <ul style="list-style-type: none"> <li>• <code>SELECT Id, Subject FROM Incident WHERE Subject='Rest1' AND isDeleted=true</code></li> <li>• <code>SELECT Id, Subject FROM Incident WHERE Subject='Rest1' AND isDeleted=false</code></li> <li>• <code>SELECT Id,(SELECT Id FROM Contacts) FROM Account WHERE isDeleted=false</code></li> </ul> |
| 6 | Order By          | <p>Order By is used to control the order of the query results.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 7 | Get Top N Records | <p>Fetch Top N records matching the criteria query.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Output Tab: |                |                                                                                            |
|-------------|----------------|--------------------------------------------------------------------------------------------|
| No.         | Field Name     | Description                                                                                |
|             | Output Fields: |                                                                                            |
| 1           | Display Name   | Displays the list of fields (Display Name) associated with the Module.                     |
| 2           | Field Name     | Displays the list of fields (Logical Name) associated with the Module.                     |
| 3           | Get Fields     | On a click of this button, the Display Name and Field Name will be populated in the table. |

## 39.4 Salesforce (REST): Update Record

### 39.4.1 Description

Salesforce (REST): Update Record step updates a single Salesforce record.

### 39.4.2 Configurations

| No. | Field Name                    | Description                                                                                                                                                                        |
|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                     | Name of the step. This name has to be unique in a single workflow.                                                                                                                 |
|     | Connection:                   |                                                                                                                                                                                    |
| 1   | Instance URL                  | Specify the instance URL of Salesforce instance. This field is mandatory.                                                                                                          |
| 2   | Consumer Key/Client ID        | Specify the connected app's consumer key which is found on the connected app's Manage Connected Apps page or from the connected app's definition. This field is mandatory.         |
| 3   | Consumer Secret/Client Secret | Specify the connected app's consumer secret, which can be found on the connected app's Manage Connected Apps page or from the connected app's definition. This field is mandatory. |
| 4   | Refresh Token                 | Specify a Refresh Token to obtain a new Access Token. This field is mandatory.                                                                                                     |
| 5   | Test Connection               | Click to verify whether the connection is established or not.                                                                                                                      |
|     |                               | <b>Note:</b>                                                                                                                                                                       |

|  |  |                                                                                                                                         |
|--|--|-----------------------------------------------------------------------------------------------------------------------------------------|
|  |  | Test Connection will only work with static (hardcoded) values and environment variables. It will not work for the previous step fields. |
|--|--|-----------------------------------------------------------------------------------------------------------------------------------------|

| Input Tab: |                       |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                |
|            | Input Fields:         |                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1          | Module                | Select the module name from which a specific record is to be updated.<br>This field is mandatory.                                                                                                                                                                                                                                                                                                                                          |
| 2          | Get                   | On click of this button, if the connection is successfully established it populates the list of Module names on the Salesforce instance.                                                                                                                                                                                                                                                                                                   |
| 3          | Record ID             | Specify the record ID of the record that is to be updated.<br>This field is mandatory.<br><br><b>Note:</b><br>Record ID can be found in the URL as shown in the following image:<br><br><b>For example:</b><br><br>a. Incident:<br><br><br><br>b. Account:<br><br> |
| 4          | Accept fields as JSON | <ol style="list-style-type: none"> <li>If the Checkbox is selected, the 'JSON' field will be used to create the record.</li> <li>If the checkbox is not selected, 'Table Fields' will be used to build the JSON to insert the record.</li> </ol>                                                                                                                                                                                           |
| 5          | JSON                  | Provide a valid JSON to update the record.<br><br><b>Sample JSON for updating the record:</b><br><br><pre>{ "Name": "CustomObject", "Email": "abc@gmail.com", "Checkbox": true, "Currency": 12345678.90, "Number": 1002, "Picklist_Single": "yes", "Picklist_Multiple": "abc;pqr", "URL": "https://www.google.com/", "Geolocation_La</pre>                                                                                                 |

|   |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|   | Table fields        | Provide the details in the Table fields if you did not select the checkbox.                                                                                                                                                                                                                                                                                                                                                                                         |
| 1 | Variable Field Name | This field is an optional field that accepts the value from the previous field or run-time parameters.                                                                                                                                                                                                                                                                                                                                                              |
| 2 | Static Field Name   | On click in the input table, fields associated with the module name will populate.                                                                                                                                                                                                                                                                                                                                                                                  |
| 3 | Field Values        | Value of the respective field associated with the field name. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                              |

## 40 ServiceNow

Service now plugin steps are used to perform operations on ServiceNow forms such as Incident, Request, Problem, Change etc.

**Compatibility:** This plugin is compatible with ServiceNow – Jakarta, London Versions

**Prerequisites:**

- ServiceNow Login account and ServiceNow instance URL and credentials.
- Internet connectivity and access to ServiceNow instance from AutomationEdge Agent Machine.

### 40.1 Service Now: Create Service Request

#### 40.1.1 Description

Service Now: Create Service Request plugin creates a ServiceNow service request.

**Note:**

- User must be authorized to access table: sys\_dictionary for using test connection button.
- If the internet connection is down, then the response is blank and workflow is aborted.
- If the selected Field Name is mapped with any Lookup List on the backend, then it will accept only valid mapped values in the Field Value and the service request is created.

But if an invalid value is provided to such Fields then the service request will be created without mapping any value to that field.

- If an invalid value is provided for the field type **Radio button**, then the invalid value is mapped as a new option in the radio button checklist.
- For search lookup fields, such as Users, Contacts, and Location provide the sys\_id.

**Limitations:**

Catalog items with additional options available on multiple tabs are not supported.

**40.1.2 Configurations**

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 2   | ServiceNow Base URL                       | Specify URL of the Service Now Instance. (e.g. https://XXXXXX.service-now.com)                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 3   | Username                                  | Specify a username to authenticate to the Service-Now instance. This field is mandatory. <ul style="list-style-type: none"> <li>• User must have appropriate permissions in ServiceNow to create a service request.</li> <li>• User must be authorized to access table: sys_dictionary</li> </ul>                                                                                                                                                                                                             |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 4   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                     |
| 5   | Password                                  | The Password to the username to authenticate to ServiceNow. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and a Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as a Text box. Else if checkbox above is disabled Password a field appears as a drop down to select fields from previous steps. |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 6   | Test Connection                           | Click Test Connection Button to verify whether the connection is established or not. ServiceNowBase URL, Username and Password fields are mandatory. Once connection is established                                                                                                                                                                                                                                                                                                                           |

|  |  |                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | <p>All requisite forms and fields in Input and Output fields are populated.</p> <p><b>Note:</b> Test Connection button, does not work for fields coming from previous steps as these field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p> <p>Once input and output field values are populated the connection fields may be replaced with previous step fields.</p> |
|--|--|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Input Tab: |                   |                                                                                                                                                                                                                                                      |

|            | Input Fields:     |                                                                                                                                                                                                                                                      |
| 1          | Catalog Name      | Specify the Catalog name in which the catalog item is present.                                                                                                                                                                                       |
| 2          | Get               | <p>Click to populate the list of catalog names available on the ServiceNow instance.</p> <p><b>Note:</b> The field is populated if the connection is successfully established. The user must be authorized to access the specified catalog name.</p> |
| 3          | Category Name     | Specify the name of the category in which the catalog item is present.                                                                                                                                                                               |
| 4          | Get               | <p>Click to populate the list of category names on the ServiceNow instance.</p> <p><b>Note:</b> The field is populated if the connection is successfully established.</p>                                                                            |
| 5          | Subcategory Name  | Specify the subcategory name in which the catalog item is present.                                                                                                                                                                                   |
| 6          | Get               | <p>Click to populate the list of Subcategory names on the ServiceNow instance.</p> <p><b>Note:</b> The field is populated if the connection is successfully established.</p>                                                                         |
| 7          | Catalog Item Name | <p>The Catalog Item name to create a service request.</p> <p><b>Note:</b> Provide the correct hierarchy path of the parent Catalog/Category/Subcategory Name to get the list of all Catalog Item Names.</p>                                          |
| 8          | Get               | <p>Click to populate the list of Catalog Item names on the ServiceNow instance.</p> <p><b>Note:</b> The field is populated if the connection is successfully established.</p>                                                                        |

|    |                       |                                                                                                                                                                                                                                                |
|----|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9  | Accept Fields As JSON | <p>If the Checkbox is selected, the 'JSON' field will be used to create a service request.</p> <p>If the checkbox is not selected 'Table Fields' will be used to build the JSON to create a service request.</p>                               |
| 10 | JSON                  | <p>Provide JSON in a valid format to create a service request.</p> <p><b>Note:</b> Provide a display name for the keys in the JSON.</p> <p><b>Sample JSON:-</b><br/>{"Additional software requirements":"Test data"," Adobe Acrobat":true}</p> |
|    | Table Fields          | <p><b>Note:</b> If 'Static Field Name' and 'Variable Field Name', both are provided in the same row in 'Table Fields' then 'Static Field Name' will be considered to build the JSON to create a service request.</p>                           |
| 11 | Variable Field Name   | <p>This field is optional and accepts the value as a field or variable. The data type is String. This field is optional.</p>                                                                                                                   |
| 12 | Static Field Name     | <p>On click of the cell in the input table, fields associated with Catalog Item will populate.<br/>The data type is String. This field is optional.</p>                                                                                        |
| 13 | Field Value           | <p>Valid values for the field associated with the field name.</p>                                                                                                                                                                              |

Output Tab:

| No. | Field Name     | Description                                                                                                  |
|-----|----------------|--------------------------------------------------------------------------------------------------------------|
|     | Output Fields: |                                                                                                              |
| 1   | Request Number | <p>Holds the request number of a service request created in ServiceNow.<br/>Default value: RequestNumber</p> |
| 2   | Sys ID         | <p>Holds the sys id of a service request created in ServiceNow.<br/>Default value: SysID</p>                 |
| 3   | Result         | <p>Holds the result of a service request created in ServiceNow.<br/>Default value: Result</p>                |

Confirmation Buttons:

| No. | Field Name | Description                                                                                                                                |
|-----|------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | OK         | <p>Click OK to confirm Delete operation.</p> <p><b>Note:</b> User must have appropriate permissions in ServiceNow to create a request.</p> |
| 2   | Cancel     | <p>Click Cancel to Cancel the operation.</p>                                                                                               |

## 40.2 Service Now: Delete Record

### 40.2.1 Description

Service Now: Delete Record plugin step deletes a record in a selected Application in Service Now (e.g. Incident, Request, Problem, Change etc.). Users can delete a record from the selected Application based on user permissions.

### 40.2.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 2   | ServiceNow Base URL                       | Specify URL of the Service Now Instance.<br>(e.g. https://XXXXXX.service-now.com)                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Username                                  | Specify a username to authenticate to the Service-Now instance. This field is mandatory. <ul style="list-style-type: none"> <li>User must have appropriate permissions in ServiceNow to delete a record through 'ServiceNow: Delete Record' step.</li> <li>User must be authorized to access table: sys_dictionary</li> </ul>                                                                                                                                                                                 |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 4   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                     |
| 5   | Password                                  | The Password to the username to authenticate to ServiceNow. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and a Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as a Text box. Else if checkbox above is disabled Password a field appears as a drop down to select fields from previous steps. |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 6   | Test Connection                           | Click Test Connection Button to verify whether the connection is established or not. ServiceNowBase URL, Username and Password fields are mandatory. Once connection is established All requisite forms and fields in Input and Output fields are populated.<br><br><b>Note:</b> Test Connection button, does not work for fields coming from previous steps as these field values can only be accessed                                                                                                       |

|  |  |                                                                                                                                                                                                                         |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | <p>when workflow is in running state. Static values and environment variables are allowed.</p> <p>Once input and output field values are populated the connection fields may be replaced with previous step fields.</p> |

| Input Tab: |                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|            | Input Fields:  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 1          | Form Name      | <p>A form name needs to be selected from the form explorer in which a document/record is to be deleted. A form explorer is opened by clicking the Get button.</p> <p><b>Note:</b> Listeners on Form Name do not work for previous step variables, static values or environment variables.</p>                                                                                                                                                                                 |
| 2          | Button: Get    | Click Get Forms Button to open Form explorer window. Select a form from the form names displayed or filter form names using the filter field.                                                                                                                                                                                                                                                                                                                                 |
| 3          | Criteria Field | Select a field from the Field Explorer window associated with the selected form.                                                                                                                                                                                                                                                                                                                                                                                              |
| 4          | Button: Get    | Click button to open Field Explorer window populated with the list of fields associated with the Form Name on the ServiceNow instance.                                                                                                                                                                                                                                                                                                                                        |
| 5          | Criteria Value | <p>Specify the valid value for the selected field. If an invalid value is provided, then no result record is returned. Additionally, provide an appropriate value to this field so as to make a unique qualification that fetches a distinct Record.</p> <p><b>Note:</b> This Criteria Fields and Criteria Value make a search query on the selected form. And if the number of records returned is exactly one then that record is deleted else the workflow is aborted.</p> |

| Confirmation Buttons: |            |                                                                                                                                                                            |
|-----------------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                   | Field Name | Description                                                                                                                                                                |
| 1                     | OK         | <p>Click OK to confirm Delete operation.</p> <p><b>Note:</b> User must have appropriate permissions in ServiceNow to delete a record through ServiceNow Delete Plugin.</p> |
| 2                     | Cancel     | Click Cancel to Cancel the operation.                                                                                                                                      |

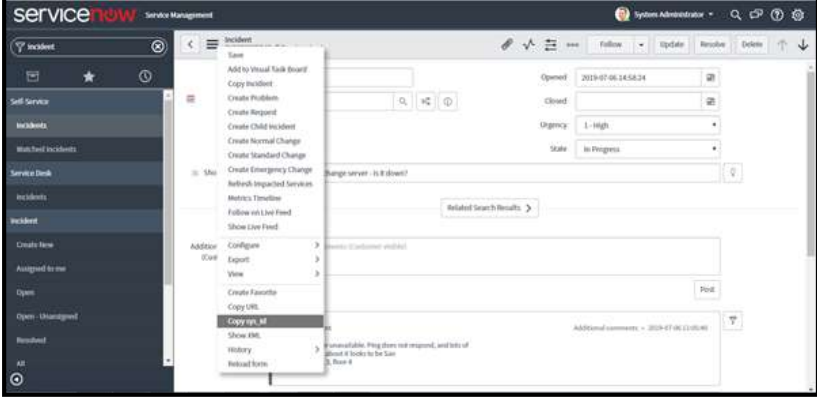

## 40.3 Service Now: Download Attachments

### 40.3.1 Description

Service Now: Download Attachment plugin step downloads all attachments associated with a ServiceNow record.

### 40.3.2 Configurations

| Connection: |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| No.         | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 1           | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 2           | ServiceNow Base URL             | Specify URL of the Service Now Instance.<br>(e.g. https://XXXXXX.service-now.com)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 3           | User Name                       | Specify a username to authenticate to the Service-Now instance. This field is mandatory. <ul style="list-style-type: none"> <li>User must have appropriate permissions in ServiceNow to Download Attachments through 'ServiceNow: Download Attachments' step.</li> <li>User must be authorized to access table: sys_dictionary</li> </ul>                                                                                                                                                                                                                                                                         |
| Password:   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 4           | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 5           | Password                        | Provide the Cherwell Password for the user. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as a Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.                                                                                                                                                                                |
| 7           | Button: Test Connection         | Click Test Connection Button to verify whether the connection is established or not. ServiceNowBase URL, Username and Password fields are mandatory. Once connection is established All requisite forms and fields in Input and Output fields are populated.<br><br><b>Note:</b> Test Connection button, does not work for fields coming from previous steps as these field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. Once input and output field values are populated the connection fields may be replaced with previous step fields. |

| Input Fields: |                                                  |                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.           | Field Name                                       | Description                                                                                                                                                                                                                                                                                                                                                                                             |
| 1             | Form Name                                        | Select a Form name from the Form Explorer window for downloading all attachments associated with a record of this form. This field is mandatory.                                                                                                                                                                                                                                                        |
| 2             | Button: Get                                      | Click Get Forms Button to open Form Explorer window with form names. Select a form name displayed or filter form names using the filter field.                                                                                                                                                                                                                                                          |
| 3             | Table Sys ID                                     | <p>The Sys ID of the record for which associated attachments need to be downloaded.</p> <p>The following screenshot shows that sys_id can be copied by right clicking on  a particular record and clicking Copy sys_id option.</p>  |
| 4             | Output Folder Path                               | Specify a folder path where files are to be downloaded or browse for a folder using the Browse File... button. Alternatively, when the folder path is coming from an input stream, you may select the field containing the folder path from the drop down list                                                                                                                                          |
| 5             | Button: Browse Folder                            | Click this button to browse for a folder to download to a Cherwell Business Object file.                                                                                                                                                                                                                                                                                                                |
| 6             | Delete Output Folder Contents before downloading | Allowed values: 'Yes', 'No'. Specify Yes to delete output folder contents before downloading else Specify No.                                                                                                                                                                                                                                                                                           |
| 7             | Add Date TimeStamp for Duplicate Files           | Allowed values: 'Yes', 'No'. Specify Yes to add Date TimeStamp for Duplicate Files.                                                                                                                                                                                                                                                                                                                     |
| 8             | Add File To Result                               | Allowed values: 'Yes', 'No'. Specify Yes to add the downloaded files to result set and display download link on AE otherwise else select No.                                                                                                                                                                                                                                                            |

## Output Tab:

| No. | Field Name        | Description                                                                                                       |
|-----|-------------------|-------------------------------------------------------------------------------------------------------------------|
| 1   | Total Files       | Specify a field name to store the total number of files in the Cherwell Business Object. This field is mandatory. |
| 2   | Downloaded Files  | Specify a field name to store the number of Downloaded Files. This field is mandatory.                            |
| 3   | Overwritten Files | Specify a field name to store the number of Overwritten Files in the output folder. This field is mandatory.      |

## Result:

There is no explicit output Result field in this plugin. Plugin results weather success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in [Appendix 1: Error Handling in IT Plugins](#) to make the error message visible on AutomationEdge Requests.

## Common Buttons:

| No. | Field Name | Description                                                                                                                                                                                                                               |
|-----|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Buttons:   |                                                                                                                                                                                                                                           |
| 1   | OK         | On click of this button. It will check the field values. If any required field values are missing then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2   | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                             |

## 40.4 Service Now: Input

### 40.4.1 Description

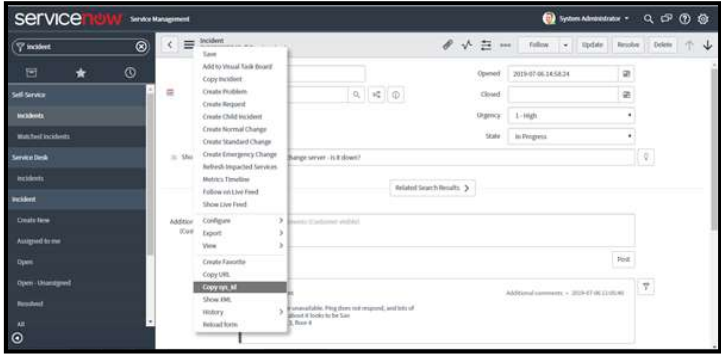

Service Now: Input plugin step fetches chosen fields for all ServiceNow records matching criteria query.

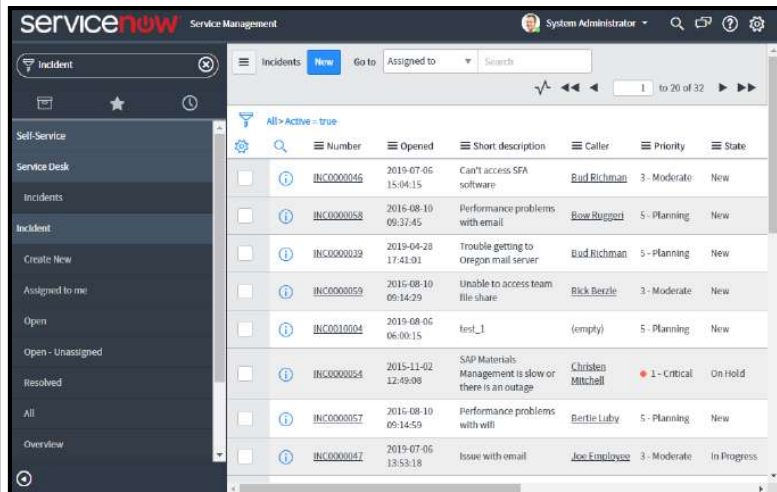

### 40.4.2 Configurations

| No. | Field Name | Description                                                        |
|-----|------------|--------------------------------------------------------------------|
| 1   | Step Name  | Name of the step. This name has to be unique in a single workflow. |

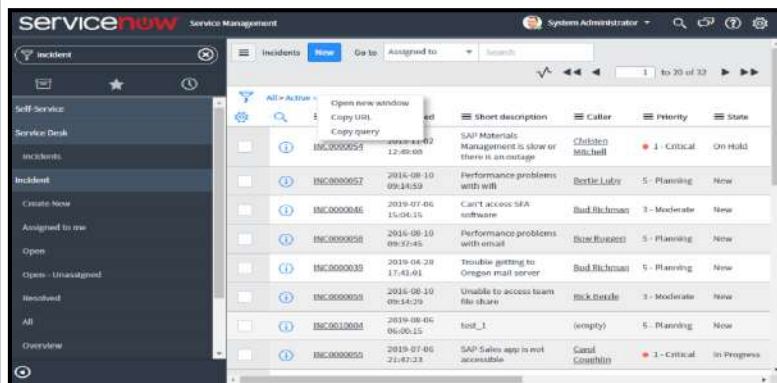

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 2 | ServiceNow Base URL                       | Specify URL of the Service Now Instance.<br>(e.g. https://XXXXXX.service-now.com)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3 | Username                                  | Specify a username to authenticate to the Service-Now instance. This field is mandatory. <ul style="list-style-type: none"> <li>User must have appropriate permissions in ServiceNow to fetch the selected fields.</li> <li>User must be authorized to access table: sys_dictionary</li> </ul>                                                                                                                                                                                                                                                                                                                     |
|   | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 5 | Password                                  | The Password to the username to authenticate to ServiceNow. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as a Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.                                                                                                          |
|   | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 6 | Test Connection                           | Click Test Connection Button to verify whether the connection is established or not. ServiceNow Base URL, Username and Password fields are mandatory. Once connection is established All requisite forms and fields in Input and Output fields are populated.<br><br><b>Note:</b> Test Connection button, does not work for fields coming from previous steps as these field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. Once input and output field values are populated the connection fields may be replaced with previous step fields. |

| 2 | Button: Get    | <p>Click Get Forms Button to open Form explorer. Select a form from the form names displayed or filter form names using the filter field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3 | Criteria Query | <p>Fetch all ServiceNow Records matching Criteria Query.</p> <p>You can create simple Criteria Query as shown in the following samples,</p> <ul style="list-style-type: none"> <li>• short_description=RPA Test</li> <li>• number= <u>INC0010097</u></li> <li>• sys_id= ef43c6d40a0a0b5700c77f9bf387afe3</li> </ul> <p>The following screenshot shows that sys_id can be copied by right clicking ≡ on a particular record.</p>  <p>Alternatively create filters in SNOW UI and copy Criteria Query from the UI. This is especially useful for complex query criteria with one or more AND, OR criteria.</p> <p>The following is a screen shot of the Incident Application. You can see the filter sign on top of the column headings. It shows the filter Active=True has been applied on All incidents.</p> |

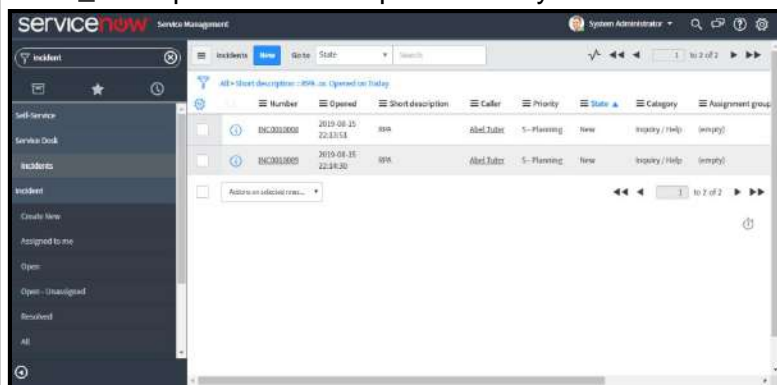

You may right click on the filter and click Copy query to copy the Criteria Query.

You may paste this as Criteria Query in the plugin step.

- active=true

You can now see the filtered list with filter applied: Short\_description=RPA or Opened Today.

Right click on the filter and click Copy query.

The Criteria query is as follows:

```
short_description=RPA^ORopened_atONToday@javascript:gs.beginningOfToday()@javascript:gs.endOfToday()
```

You may now use it in the Plugin step.

For a detailed description of how to create Criteria query in SNOW UI refer [Appendix 5: Build Criteria Query in SNOW UI](#).

**Additional information for Criteria Query:**

To get the display value and/or the actual value of the field in the response, use the following query parameter in the Criteria Query: **sysparm\_display\_value={valid\_value}**.

**Valid values:**

- a) true: Returns the display values for all fields.
- b) false: Returns the actual values from the database of ServiceNow.
- c) all: Returns both actual and display values.

Default value: false

**Syntax:**

```
<Criteria Query>&sysparm_display_value=<valid_value>
```

**Example query:**

```
number=INC0010001&sysparm_display_value=true
```

There is no preferred method for setting sysparm\_display\_value. However, specifying the display value may cause performance issues since it is not reading directly from the database of ServiceNow and may include referencing other fields and records.

|   |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| 1   | Field Name     | <p>Click Field Name to populate the list of fields associated with the Form Name on the ServiceNow instance. The name of the particular field that has to be fetched should be selected. Multiple fields can be selected from the list displayed on click. The selected fields will be the output parameters of this plugin.</p> <p><b>Note:</b> If selected field name is Lookup Field (caller_id, assigned to, etc.) then the field values for such fields is not displayed, the URL to get the actual value of that field is returned. The users can use Rest Client to fetch the actual values.</p> |
| 2   | Output Field   | <p>The output field name to store the fields chosen in the Field Name. These output fields will hold the respective values of the Field name selected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2   | ServiceNow Base URL                       | Specify URL of the Service Now Instance.<br>(e.g. https://XXXXXX.service-now.com)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3   | Username                                  | Specify a username to authenticate to the Service-Now instance. This field is mandatory. <ul style="list-style-type: none"> <li>User must have appropriate permissions in ServiceNow to insert a record through 'ServiceNow: Insert Record' step.</li> <li>User must be authorized to access table: sys_dictionary</li> </ul>                                                                                                                                                                             |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 4   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                 |
| 5   | Password                                  | The Password to the username to authenticate to ServiceNow. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as a Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|   |                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | Test Connection | <p>Click Test Connection Button to verify whether the connection is established or not. ServiceNow Base URL, Username and Password fields are mandatory. Once connection is established All requisite forms and fields in Input and Output fields are populated.</p> <p><b>Note:</b> Test Connection button, does not work for fields coming from previous steps as these field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. Once input and output field values are populated the connection fields may be replaced with previous step fields.</p> |

**Note:**

If the selected Field Name is mapped with any Lookup List on the backend then, in that case, it will accept only valid mapped values in the Field Value and the ticket will be created. But if an invalid value is provided to such Fields then the ticket will take the default value mapped with that Field on the backend.

## 40.6 Service Now: Update Record

### 40.6.1 Description

Service Now: Update Record plugin step is designed to update a record in a ServiceNow Application such as Incident, Request, Problem, Change etc.

### 40.6.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 2   | ServiceNow Base URL                       | Specify URL of the Service Now Instance.<br>(e.g. https://XXXXXX.service-now.com)                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3   | Username                                  | Specify a username to authenticate to the Service-Now instance. This field is mandatory. <ul style="list-style-type: none"> <li>User must have appropriate permissions in ServiceNow to update a record through 'ServiceNow: Update Record' step.</li> <li>User must be authorized to access table: sys_dictionary</li> </ul>                                                                                                                                                                             |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 4   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                 |
| 5   | Password                                  | The Password to the username to authenticate to ServiceNow. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as a Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
|     | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 6   | Test Connection                           | Click Test Connection Button to verify whether the connection is established or not. ServiceNow Base URL, Username and Password fields are mandatory. Once connection is established All requisite forms and fields in Input and Output fields are populated.                                                                                                                                                                                                                                             |

|  |                                                                                                                                                                                                                                                                                                                                                             |
|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  | <p><b>Note:</b> Test Connection button, does not work for fields coming from previous steps as these field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p> <p>Once input and output field values are populated the connection fields may be replaced with previous step fields.</p> |

| 1          | Form Name             | <p>A form name needs to be selected from the form explorer in which a document/record is to be updated. A form explorer is opened by clicking the Get Forms button.</p> <p><b>Note:</b> Listeners on Form Name do not work for previous step variables, static values or environment variables.</p>                                                                                                                                                                                                                                                                                             |
| 2          | Button: Get           | Click Get Forms Button to open Form explorer. Select a form from the form names displayed or filter form names using the filter field.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 3          | Criteria Field        | Double click on this field to get the list of fields associated with the selected form.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| 4          | Button: Get           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 5          | Criteria Value        | <p>Specify the valid value for the selected field. If an invalid value is provided then no result record is returned. Additionally, provide an appropriate value to this field so as to make a unique qualification that fetches a distinct Record.</p> <p><b>Note:</b> This Criteria Fields and Criteria Value will make a search query on the selected form. And if the number of records returned is exactly one then that record is updated else the workflow is aborted.</p>                                                                                                               |
| 6          | Accept fields as JSON | Enable checkbox to accept field names as JSON input.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 7          | JSON                  | <p>If 'Accept Fields as JSON' checkbox is enabled this field is activated. Choose a field containing the JSON text. JSON text should contain key-value pairs enclosed by double quotes (") enclosure with a colon separating them. Key-value pairs de<b>Note:</b> fields and their values to populate. Provide all the required or mandatory fields as well as other fields to be updated as keys in the JSON.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>Lookup field values must exactly match existing values in the Service Now instance else it is ignored.</li> </ul> |

- The JSON could be from any input step such as Generate rows, Text File input, Excel Input et al. In SNOW steps JSON text can only be accepted from input fields from previous steps and not as files directly. At least one input field must be provided. Either using JSON or Table Fields.

Following is a sample JSON text for updating an Incident record: This JSON text has one key-value pair denoting field and its value to populate.

e.g. on Incident application there could be JSON field as shown below where field JSON is coming from the input stream such as a field in Generate Rows, CSV etc.

| # | Variable Field Name | Static Field Name | Field Value                          |
|---|---------------------|-------------------|--------------------------------------|
| 1 | {short_description} |                   | Backup Failed                        |
| 2 | {comments}          |                   | Backup took an hour before it failed |

Sample value of JSON for incident application:  
`{"short_description": "Test_JSON_update_Incident"}`

Following is a sample JSON for updating a record in Problem application.

e.g. on Problem Application there could be JSON field as shown below, where field JSON is coming from the input stream such as a field in Generate Rows, CSV etc.

Sample value of JSON1 for Problem application:  
`{"short_description": "Hello There!", "work_Note:s": "Test updating Record."}`

|   |                     |                                                                                                                                                                                                                                                                                                                                                                                          |
|---|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Table Fields:       |                                                                                                                                                                                                                                                                                                                                                                                          |
| 8 | Variable Field Name | This is an optional field. Choose a field in input stream from drop down list or provide a user or system defined variable.                                                                                                                                                                                                                                                              |
| 9 | Static Field Name   | On click of this column field, it opens a dialog with the list of available form fields of the provided Form Name. The name of the fields to be inserted should be selected. Multiple fields can be selected from the list displayed on click. The selected field's values below will be inserted in the record.<br><br>Validation: The plugin validates field names from remedy server. |

10 Field Value

Provide field values to be updated in the corresponding chosen fields.  
Following, is a sample snapshot of input tab with Table Fields with Static Field Name.

Following, is a sample snapshot of input tab with Table Fields with Variable Field Name.

| # | Variable Field Name | Static Field Name | Field Value                                |
|---|---------------------|-------------------|--------------------------------------------|
| 1 |                     | short_description | Backup Failed                              |
| 2 |                     | comments          | Backup took half an hour before in failed. |

**Note:**  
If the selected Field Name is mapped with any Lookup List on the backend then, in that case, it will accept only valid mapped values in the Field Value and the ticket will be created. But if an invalid value is provided to such Fields then the ticket will take the default value mapped with that Field on the backend.

Output Tab:

| No. | Field Name       | Description                                                                                                                                                   |
|-----|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Output Fields:   |                                                                                                                                                               |
| 1   | SysId Field Name | Each record in the instance is identified by a unique 32-character GUID (Globally Unique ID) called a Sys ID (sys_id). Holds the sysid of the record created. |
| 2   | Result           | Provide a field name to hold the result of the step.                                                                                                          |

Confirmation Buttons:

| No. | Field Name | Description                                                                                                                                                     |
|-----|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | OK         | Click OK to confirm Update operation.<br><b>Note:</b> User must have appropriate permissions in ServiceNow to update a record through ServiceNow Update Plugin. |

|   |        |                                       |
|---|--------|---------------------------------------|
| 2 | Cancel | Click Cancel to Cancel the operation. |

## 40.7 Service Now: Upload Attachment

### 40.7.1 Description

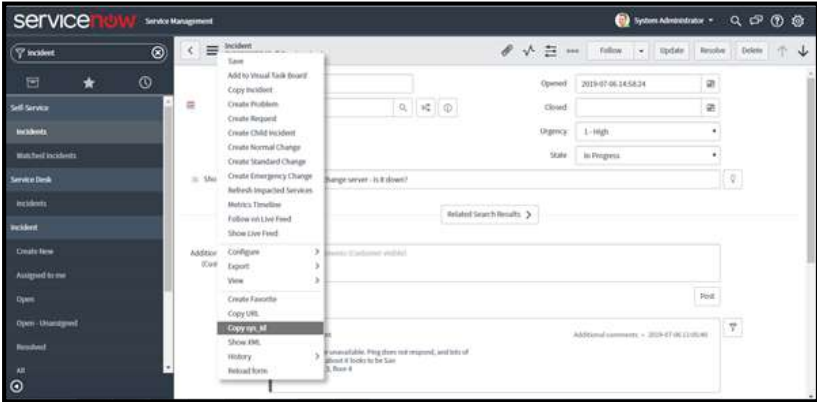

Service Now: Upload Attachment step is used to upload a file to a Service Now record.

### 40.7.2 Configurations

| Connection: |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.         | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 1           | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                 |
| 2           | ServiceNow Base URL             | Specify URL of the Service Now Instance. (e.g. https://XXXXXX.service-now.com)                                                                                                                                                                                                                                                                                                                                                     |
| 3           | User Name                       | Specify a username to authenticate to the Service-Now instance. This field is mandatory. <ul style="list-style-type: none"> <li>• User must have appropriate permissions in ServiceNow to upload attachments through ‘ServiceNow: Upload Attachments’ step.</li> <li>• User must be authorized to access table: sys_dictionary</li> </ul>                                                                                          |
| Password:   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4           | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                          |
| 5           | Password                        | Provide the Cherwell Password for the user. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as a Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |
| 6           | Button: Test Connection         | Click Test Connection Button to verify whether the connection is established or not. ServiceNow Base URL, Username and Password fields are mandatory. Once connection is established All requisite forms and fields in Input and Output fields are populated.<br><br><b>Note:</b> Test Connection button, does not work for fields coming from previous steps as these field values can only be accessed                           |

when workflow is in running state. Static values and environment variables are allowed. Once input and output field values are populated the connection fields may be replaced with previous step fields.

**Input Fields:**

| No. | Field Name      | Description                                                                                                                                                                                                                                                                                                                                                  |
|-----|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Form Name       | Select a Form name from the Form Explorer window for which we need to upload an attachment.                                                                                                                                                                                                                                                                  |
| 2   | Button: Get     | Click this button, to populate the list of form names in the ServiceNow instance in the Form Explorer window.                                                                                                                                                                                                                                                |
| 3   | Table Sys ID    | <p>The Sys ID of the record to which an attachment needs to be uploaded.</p> <p>The following screenshot shows that sys_id can be copied by right clicking  on a particular record.</p>  |
| 4   | Input File Path | <ul style="list-style-type: none"> <li>• Provide the absolute file path for the file to be uploaded as an attachment.</li> <li>• Alternately, Browse the file using the Browse button.</li> <li>• Alternatively when the filename is coming from an input stream, you may select the field containing the filename from the drop down list.</li> </ul>       |
| 5   | Button: Browse  | Click button to browse a file to be uploaded to a SNOW instance.                                                                                                                                                                                                                                                                                             |

**Result:**

There is no explicit output Result field in this plugin. Plugin results whether success or error can be captured using Set Workflow Result. Errors can be captured in error handling as discussed in [Appendix 1: Error Handling in IT Plugins](#) to make the error message visible on AutomationEdge Requests.

| Common Buttons: |            |                                                                                                                                                                                                                                           |

| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values                                                                                                                                                             |

## 41 SharePoint Online

SharePoint Online Plugin has been designed to perform and automate SharePoint Online operations.

**Compatibility:** SharePoint Online

Following sections describe the Plugin steps:

### 41.1 Copy File or Folder

#### 41.1.1 Description

Copy File or Folder plugin step copies a file or folder from SharePoint online Document Library source path to a destination Document Library path on SharePoint Online.

#### 41.1.2 Prerequisites

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type | Permission type | Permission (from least to most privileged) |
|--------------|-----------------|--------------------------------------------|
|              |                 |                                            |

|                        |           |                                                           |
|------------------------|-----------|-----------------------------------------------------------|
| Work or School account | Delegated | Files.ReadWrite, Files.ReadWrite.All, Sites.ReadWrite.All |
|------------------------|-----------|-----------------------------------------------------------|

### 41.1.3 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Specify the name of the step. This name has to be unique in a single workflow. This is a mandatory field.                                                                                                                                     |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.<br>If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                              |
| 4              | Refresh Token                   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                                                  |
| 5              | Test Connection                 | Verifies whether the connection is established or not.<br><br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables.                             |

| Input Tab: |                              |                                                                                                                                                                                      |
|------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name                   | Description                                                                                                                                                                          |
|            | Input Fields:                |                                                                                                                                                                                      |
| 1          | Site Relative URL            | Select the SharePoint site-relative URL. {Tenant Name}.sharepoint.com:/{Sharepoint Site Path<br>For example: firstUser.sharepoint.com:/sites/TestingSite. This is a mandatory field. |
| 2          | Source Document Library Name | Specify the name of source Document Library in which file or folder is present. This is a mandatory field.                                                                           |
| 3          | Source File Or Folder Path   | Specify the full source path of the file or folder. For example, .:\"Folder1/Example_1.txt\", \"Folder1/Folder2\". This is a mandatory field.                                        |

|   |                                   |                                                                                                                                                                                                      |
|---|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                   | <b>Note:</b> The source path will start from root of Document Library.                                                                                                                               |
| 4 | Destination Document Library Name | Specify the name of the destination Document Library in which file or folder is to be copied. This is a mandatory field.                                                                             |
| 5 | Destination Folder Path           | Specify the full destination path of folder. The path must start from the root of Document Library. For example, \: "Folder1/Folder2". To copy at root, give path as '/'. This is a mandatory field. |
|   | Additional Fields                 |                                                                                                                                                                                                      |
| 6 | Create Folder (if not exist)      | Create folder in the given document library if it does not exist. Default value: No                                                                                                                  |
| 7 | File Or Folder Name after Copy    | Specify the name of file or folder after copy.<br><br><b>Note:</b> In case of file give name along with extension.                                                                                   |

## 41.2 Create Document Library or List

### 41.2.1 Description

Document Library or List plugin step creates a Generic List and Document Library in a specified SharePoint Online site.

### 41.2.2 Prerequisites

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type           | Permission type | Permission (from least to most privileged) |
|------------------------|-----------------|--------------------------------------------|
| Work or School account | Delegated       | Sites.Manage.All                           |

### 41.2.3 Configurations

| Configuration: |             |                                                                                                           |
|----------------|-------------|-----------------------------------------------------------------------------------------------------------|
| No.            | Field Name  | Description                                                                                               |
| 1              | Step Name   | Specify the name of the step. This name has to be unique in a single workflow. This is a mandatory field. |
|                | Connection: |                                                                                                           |

|   |                                 |                                                                                                                                                                                                                                               |
|---|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3 | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.<br>If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                              |
| 4 | Refresh Token                   | Specify or select the Refresh Token generated using ClientID, which is generated after creating App in Azure AD. This is a mandatory field.                                                                                                   |
| 5 | Test Connection                 | Verifies whether the connection is established or not.<br><br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables.                             |

### 41.5.3 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Specify the name of the step. This name has to be unique in a single workflow. This is a mandatory field.                                                                                                                                     |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.<br>If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                              |
| 4              | Refresh Token                   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                                                  |
| 5              | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables.                                 |

| Input Tab: |                   |                                                                                                                                                                            |
|------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name        | Description                                                                                                                                                                |
|            | Input Fields:     |                                                                                                                                                                            |
| 1          | Site Relative URL | Select the SharePoint site-relative URL. {Tenant Name}.sharepoint.com:/{Sharepoint Site Path<br>Ex-firstUser.sharepoint.com:/sites/TestingSite. This is a mandatory field. |

|   |                       |                                                                                                                                                                     |
|---|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                       | <b>Note:</b> For root site (Communication Site), no need to give {sharepoint site path}                                                                             |
| 2 | Document Library Name | Select the name of Document Library in which to perform operation. This is a mandatory field.                                                                       |
| 3 | File Or Folder Path   | Select the path of File or Folder to be deleted (from root of Document Library). (Example: "Folder1'/Folder2" or "Folder1/Example.txt"). This is a mandatory field. |

## 41.6 Delete List Column

### 41.6.1 Description

Delete List Column plugin step deletes a column from the Generic List present in the specified site in SharePoint Online.

### 41.6.2 Prerequisites

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type           | Permission type | Permission (from least to most privileged) |
|------------------------|-----------------|--------------------------------------------|
| Work or School account | Delegated       | Sites.Manage.All,<br>Sites.FullControl.All |

### 41.6.3 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                            |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.                                                                                                                                                      |

|   |                 |                                                                                                                                                                                                               |
|---|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                                                                                          |
| 4 | Refresh Token   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                  |
| 5 | Test Connection | Verifies whether the connection is established or not.<br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables. |

| Input Tab: |                   |                                                                                                                                                                                                                                                                            |

This is a mandatory field.                                                                                                                                                                           |
| 3          | Item ID           | Select ID of item to be deleted. This is a mandatory field.                                                                                                                                                                                                               |

## 41.8 Download File

### 41.8.1 Description

Download File plugin step downloads a file from the Document Library present in a specified site in SharePoint Online.

### 41.8.2 Prerequisites

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type           | Permission type | Permission (from least to most privileged)                                                            |
|------------------------|-----------------|-------------------------------------------------------------------------------------------------------|
| Work or School account | Delegated       | Files.Read, Files.ReadWrite, Files.Read.All, Files.ReadWrite.All, Sites.Read.All, Sites.ReadWrite.All |

#### 41.8.2.1 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Specify the name of the step. This name has to be unique in a single workflow. This is a mandatory field.                                                                                                                                     |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.<br>If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                              |
| 4              | Refresh Token                   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                                                  |

|   |                 |                                                                                                                                                                                                                          |
|---|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | Test Connection | <p>Verifies whether the connection is established or not.</p> <p><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables.</p> |
|---|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Input Tab: |                       |                                                                                                                                                                                                                                                                                   |
|------------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name            | Description                                                                                                                                                                                                                                                                       |
|            | Input Fields:         |                                                                                                                                                                                                                                                                                   |
| 1          | Site Relative URL     | <p>Select the SharePoint site-relative URL. {Tenant Name}.sharepoint.com:/{Sharepoint Site Path<br/>Ex-firstUser.sharepoint.com:/sites/TestingSite. This is a mandatory field.</p> <p><b>Note:</b> For root site (Communication Site), no need to give {sharepoint site path}</p> |
| 2          | Document Library Name | Select the name of source Document Library in which file is present. This is a mandatory field.                                                                                                                                                                                   |
| 3          | SharePoint File Path  | Select the full path (from root of Document Library). (ex: "Folder1/Example_1.txt", "Folder1/Folder2"). This is a mandatory field.                                                                                                                                                |
| 4          | Output Folder Path    | <p>Select the local machine full folder path where file to be downloaded. If folders are not present, then WF will create the folder. This is a mandatory field.</p> <p><b>Note:</b> If path is invalid then given folders will be created at Process Studio directory.</p>       |

| Additional Input tab: |                                                  |                                                                                                                                                                             |
|-----------------------|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.                   | Field Name                                       | Description                                                                                                                                                                 |
|                       | Input Fields:                                    |                                                                                                                                                                             |
| 1                     | Delete Output Folder Contents before Downloading | Select the local folder from which all files and folder are deleted before downloading. Allowed value is "Yes", "No".                                                       |
| 2                     | Add DateTimeStamp for Duplicate Files            | Select to add timestamp to newly downloaded folder if local folder contains same file name. If value is false, then file will be overwritten. Allowed value is "Yes", "No". |
| 3                     | Add File To Result                               | Select to add downloaded file in result of workflow. Allowed value is "Yes", "No".                                                                                          |

| Output tab:      |                                                         |
|------------------|---------------------------------------------------------|
| Field Name       | Description                                             |
| Output Fields:   |                                                         |
| File Overwritten | Specify if file is overwritten and returns Yes else No. |

## 41.9 Get List Items

### 41.9.1 Description

Get List Items plugin step gets items from the Generic List present in the specified site in SharePoint Online.

### 41.9.2 Prerequisites

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type               | Permission type | Permission (from least to most privileged) |
|----------------------------|-----------------|--------------------------------------------|
| Work or School account     | Delegated       | Sites.Read.All,<br>Sites.ReadWrite.All     |
| Personal Microsoft account | Delegated       | Sites.Read.All,<br>Sites.ReadWrite.All     |

### 41.9.3 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Specify the name of the step. This name has to be unique in a single workflow. This is a mandatory field.                                                                                                                                     |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.                                                                                                                                                      |

|   |                 |                                                                                                                                                                                                               |
|---|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                                                                                          |
| 4 | Refresh Token   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                  |
| 5 | Test Connection | Verifies whether the connection is established or not.<br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables. |

| Input Tab: |                   |                                                                                                                                                                                                                                                                            |
|------------|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name        | Description                                                                                                                                                                                                                                                                |
|            | Input Fields:     |                                                                                                                                                                                                                                                                            |
| 1          | Site Relative URL | Select the SharePoint site-relative URL. {Tenant Name}.sharepoint.com:/{Sharepoint Site Path<br>Ex-firstUser.sharepoint.com:/sites/TestingSite. This is a mandatory field.<br><br><b>Note:</b> For root site (Communication Site), no need to give {sharepoint site path}. |
| 2          | List Name/ID      | Select the name or ID of Generic List for which you want to get items. This is a mandatory field.                                                                                                                                                                          |
| 3          | Select Columns    | Select if you want to get only specific columns then give name of those columns. Use comma (,) to give multiple columns. By default, this step will get all columns. If any column that does not exist in the result set, then it will be ignored.                         |

| Output tab:    |                                                                       |
|----------------|-----------------------------------------------------------------------|
| Field Name     | Description                                                           |
| Output Fields: |                                                                       |
| JSON Output    | Specify the output JSON in this field. Default value is 'JSONOutput'. |

## 41.10 Move File or Folder

### 41.10.1 Description

Move File or Folder plugin moves a file or folder from source path to destination path in same Document Library present in a specified site in SharePoint Online.

### 41.10.2 Prerequisites

© 2023 AutomationEdge Inc All Rights Reserved.  
This document is for your company's internal use only and may not be distributed to any third party.

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type           | Permission type | Permission (from least to most privileged)                |
|------------------------|-----------------|-----------------------------------------------------------|
| Work or School account | Delegated       | Files.ReadWrite, Files.ReadWrite.All, Sites.ReadWrite.All |

### 41.10.3 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Specify name of the step. This name has to be unique in a single workflow. This is a mandatory step.                                                                                                                                          |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.<br>If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                              |
| 4              | Refresh Token                   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                                                  |
| 5              | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables.                                 |

| Input Tab: |                   |                                                                                              |
|------------|-------------------|----------------------------------------------------------------------------------------------|
| No.        | Field Name        | Description                                                                                  |
|            | Input Fields:     |                                                                                              |
| 1          | Site Relative URL | Select the SharePoint site-relative URL. {Tenant Name}.sharepoint.com:/{Sharepoint Site Path |

|   |                            |                                                                                                                                                                                                       |
|---|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                            | Ex-firstUser.sharepoint.com:/sites/TestingSite. This is a mandatory field.<br><br><b>Note:</b> For root site (Communication Site), no need to give {sharepoint site path}. This is a mandatory field. |
| 2 | Document Library Name      | Select the name of Document Library in which file/folder is present. This is a mandatory field.                                                                                                       |
| 3 | Source File or Folder Path | Select the full source path (from root of Document Library). (ex.:\:"Folder1/Example_1.txt", "Folder1/Folder2"). This is a mandatory field.                                                           |
| 4 | Destination Folder Path    | Select the full destination path of folder (from root of Document Library). (ex.:\: "Folder1/Folder2"). To move at root give path as '/'. This is a mandatory field.                                  |

| Additional Input tab: |                                |                                                                                                             |
|-----------------------|--------------------------------|-------------------------------------------------------------------------------------------------------------|
| No.                   | Field Name                     | Description                                                                                                 |
|                       | Input Fields:                  |                                                                                                             |
| 1                     | Create Folder (if not exist)   | Select if you want create folder in given document library if it does not exist.                            |
| 2                     | File Or Folder Name after Move | Select the name of moved file/folder.<br><b>Note:</b> In case of file, give full name along with extension. |

## 41.11 Rename File or Folder

### 41.11.1 Description

Rename File or Folder plugin rename a File or Folder from Document Library present in a specified site in SharePoint Online.

### 41.11.2 Prerequisites

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type | Permission type | Permission (from least to most privileged) |
|--------------|-----------------|--------------------------------------------|
|              |                 |                                            |

|                        |           |                                                           |
|------------------------|-----------|-----------------------------------------------------------|
| Work or School account | Delegated | Files.ReadWrite, Files.ReadWrite.All, Sites.ReadWrite.All |
|------------------------|-----------|-----------------------------------------------------------|

### 41.11.3 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Specify the name of the step. This name has to be unique in a single workflow. This is a mandatory field.                                                                                                                                     |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.<br>If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                              |
| 4              | Refresh Token                   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                                                  |
| 5              | Test Connection                 | Verifies whether the connection is established or not.<br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables.                                 |

|            | Input Fields:         |                                                                                                                                                                                                                                                                            |
| 1          | Site Relative URL     | Select the SharePoint site-relative URL. {Tenant Name}.sharepoint.com:/{Sharepoint Site Path<br>Ex-firstUser.sharepoint.com:/sites/TestingSite. This is a mandatory field.<br><br><b>Note:</b> For root site (Communication Site), no need to give {sharepoint site path}. |
| 2          | Document Library Name | Select name of Document Library in which to perform operation. This is a mandatory field.                                                                                                                                                                                  |

|   |                     |                                                                                                                                                             |
|---|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | File Or Folder Path | Select path of file or folder to be renamed (from root of Document Library). (ex.: "Folder1'/Folder2" or "Folder1/Example.txt"). This is a mandatory field. |
| 4 | New Name            | Select the new name for same file or folder. This is a mandatory field.                                                                                     |

## 41.12 Upload File

### 41.12.1 Description

Upload File plugin uploads a file from local machine to Document Library present in a specified site in SharePoint Online.

### 41.12.2 Prerequisites

- SharePointOnline instance with access details.
- Refresh Token generated using ClientID, which is generated after creating App in Azure AD.
- You require the following permissions for app on Azure:

| Account Type           | Permission type | Permission (from least to most privileged)                |
|------------------------|-----------------|-----------------------------------------------------------|
| Work or School account | Delegated       | Files.ReadWrite, Files.ReadWrite.All, Sites.ReadWrite.All |

### 41.12.3 Configurations

| Configuration: |                                 |                                                                                                                                                                                                                                               |
|----------------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.            | Field Name                      | Description                                                                                                                                                                                                                                   |
| 1              | Step Name                       | Specify the name of the step. This name has to be unique in a single workflow. This is a mandatory field.                                                                                                                                     |
|                | Connection:                     |                                                                                                                                                                                                                                               |
| 2              | Client ID                       | Specify the Client ID of SharePoint App. For information about creating a client ID, see <a href="#">Appendix 17: SharePoint: App Registration &amp; Refresh Token Generation</a> . The field data type is String. This is a mandatory field. |
| 3              | Accept value as variable/static | Select the checkbox if you want enter the Refresh Token name in the Refresh Token field.<br>If you do not select the checkbox, then you can select the refresh token in the Refresh Token field.                                              |

|   |                 |                                                                                                                                                                                                               |
|---|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Refresh Token   | Specify or select the Refresh Token generated using ClientID, which is generated after creating <a href="#">App in Azure AD</a> . This is a mandatory field.                                                  |
| 5 | Test Connection | Verifies whether the connection is established or not.<br><b>Note:</b> This connection will not work for the previous step variables. The button will only work with static values and environment variables. |

| Input Tab: |                        |                                                                                                                                                                                                                                                                            |
|------------|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name             | Description                                                                                                                                                                                                                                                                |
|            | Input Fields:          |                                                                                                                                                                                                                                                                            |
| 1          | Site Relative URL      | Select the SharePoint site-relative URL. {Tenant Name}.sharepoint.com:/{Sharepoint Site Path<br>Ex-firstUser.sharepoint.com:/sites/TestingSite. This is a mandatory field.<br><br><b>Note:</b> For root site (Communication Site), no need to give {sharepoint site path}. |
| 2          | Document Library Name  | Select name of Document Library in which to perform operation. This is a mandatory field.                                                                                                                                                                                  |
| 3          | File To Upload         | Browse and select full local file path to be uploaded. (ex.:\: "C:\\Temp\\Sample.txt"). This is a mandatory field.                                                                                                                                                         |
| 4          | SharePoint Folder Path | Select SharePoint path to upload the file at (from root of Document Library). (ex.:\: "Folder1/Folder2"). To copy at root, give path as '/'. This is a mandatory field.                                                                                                    |

| Additional Input tab |                              |                                                                                                     |
|----------------------|------------------------------|-----------------------------------------------------------------------------------------------------|
| No.                  | Field Name                   | Description                                                                                         |
| 1                    | If File Exists on SharePoint | Select if file is already present at destination path. Allowed Values: 'fail', 'replace', 'rename'. |

## 42 Smartsheet

### Prerequisites:

Users must have:

- Smartsheet account with subscription, with an Administrative access.
- Access token. Go to the following link to generate your access token:  
<https://smartsheet.redoc.ly/#section/API-Basics/Raw-Token-Requests>

## 42.1 Smartsheet: Add Columns

### 42.1.1 Description

Smartsheet: Add Columns step adds columns in the Smartsheet.

#### Reference:

- **API Documentation:** <https://smartsheet.redoc.ly/tag/columns/#operation/columns-addToSheet>
- **Allowed column type:** <https://smartsheet.redoc.ly/tag/columns/#operation/columns-addToSheet>

### 42.1.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                  |
|-----|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                           |
|     | Connection:                     |                                                                                                                                                                                                                              |
| 1   | Accept value as variable/static | Leave checkbox unchecked to accept Access Token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Access Token field to appear as Text box.                            |
| 2   | Access Token                    | Generate the access token in your Smartsheet account. This field is mandatory.                                                                                                                                               |
| 3   | Test Connection                 | Click to verify whether the connection is established or not.<br><br><b>Note:</b><br>Test Connection will only work with static (hardcoded) values and environment variables. It will not work for the previous step fields. |

| Input Tab: |                       |                                                                                                                                                                                       |
|------------|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name            | Description                                                                                                                                                                           |
|            | Input Fields:         |                                                                                                                                                                                       |
| 1          | SheetID               | Provide the Sheet ID that uniquely identifies the Smartsheet. The field is mandatory.                                                                                                 |
| 2          | Get                   | Click to fetch the list of available sheet ID.                                                                                                                                        |
| 3          | Accept fields as JSON | 3. If the Checkbox is selected, the 'JSON' field will be used to add column(s).<br>4. If the checkbox is not selected 'Table Fields' will be used to build the JSON to add column(s). |
| 4          | JSON                  | Provide a valid JSON to insert the record.                                                                                                                                            |

|     |               |                                                                                                                                                                                                                                  |
|-----|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     |               | <p><b>Sample Syntax:</b></p> <pre>[{"title": "New MultiPicklist Column 1", "type": "MULTI_PICKLIST", "options": ["First", "Second", "Third"], "index": 4}, {"title": "New Date Column", "type": "DATE", "index": 4}]</pre>       |
| 5   | Table fields  | Provide the details in the Table fields if you did not select the checkbox.                                                                                                                                                      |
| 5.a | Column Name   | Specify the name of the column title for which you want to set the column.<br>The field is mandatory.                                                                                                                            |
| 5.b | Data Type     | Datatype of respective field associated with the Column Name. This field is mandatory.<br><b>Allowed Column types:</b><br>"CHECKBOX", "CONTACT_LIST", "DATE", "MULTI_CONTACT_LIST", "MULTI_PICKLIST", "PICKLIST", "TEXT_NUMBER". |
| 5.c | Display Order | Specify the column index or position. This number is zero-based.<br><b>NOTE:</b> If we provide multiple column names, then the display order value / number should be same.                                                      |
| 5.d | Options       | Specify the options if you have selected <i>MULTI_PICKLIST</i> or <i>PICKLIST</i> in the <b>Data Type</b> field.                                                                                                                 |

## 42.2 Smartsheet: Append Row

### 42.2.1 Description

Smartsheet: Append Row step appends row in the Smartsheet.

**Note:** Execute the following API in the Postman and get the Column IDs from the response.

**API URL:** <https://api.smartsheet.com/2.0/sheets/{SmartSheetID}>

**Reference:**

<https://smartsheet.redoc.ly/#section/CopyOrMoveRowResult-object>

### 42.2.2 Configurations

| No. | Field Name                      | Description                                                                                                                    |
|-----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                             |
|     | Connection:                     |                                                                                                                                |
| 1   | Accept value as variable/static | Leave checkbox unchecked to accept Access Token value from a field in the previous steps of the stream using a drop down list. |

|   |                 |                                                                                                                                                                                                                              |
|---|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                 | Else enable checkbox for Access Token field to appear as Text box.                                                                                                                                                           |
| 2 | Access Token    | Generate the access token in your Smartsheet account. This field is mandatory.                                                                                                                                               |
| 3 | Test Connection | Click to verify whether the connection is established or not.<br><br><b>Note:</b><br>Test Connection will only work with static (hardcoded) values and environment variables. It will not work for the previous step fields. |

| Input Tab: |                       |                                                                                                                                                                                                                                                                                                                                                                                |
|------------|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name            | Description                                                                                                                                                                                                                                                                                                                                                                    |
|            | Input Fields:         |                                                                                                                                                                                                                                                                                                                                                                                |
| 1          | Smartsheet ID*        | Provide the Smartsheet ID that uniquely identifies the Smartsheet Subscription. This field is mandatory.                                                                                                                                                                                                                                                                       |
| 2          | Accept fields as JSON | <ol style="list-style-type: none"> <li>If the Checkbox is selected, the 'JSON' field will be used to insert the row at the top or bottom.</li> <li>If the checkbox is not selected 'Table Fields' will be used to build the JSON to insert the row at the top or bottom.</li> </ol>                                                                                            |
| 4          | JSON                  | Provide a valid JSON to insert the record.<br><br><b>Sample Syntax:</b><br><pre> [{"toTop toBottom":true,"cells": [{"columnId":columnIdValue, "value":"cellValue"}, {"columnId":columnIdValue, "value":BooleanValue}]]           </pre> Example: [{"toTop":true, "cells": [{"columnId":6907388603197316, "value":"TestValue"}, {"columnId":6907388603197318, "value":true}]]"; |
| 5          | Table fields          | Provide the details in the Table fields if you did not select the checkbox.                                                                                                                                                                                                                                                                                                    |
| 5.a        | Variable Field Name   | This field is an optional field that accepts the value from the previous field or run-time parameters.                                                                                                                                                                                                                                                                         |
| 5.b        | Static Field Name     | On click in the input table, fields associated with the module name will populate.                                                                                                                                                                                                                                                                                             |
| 5.c        | Field Values          | Value of the respective field associated with the field name. This field is mandatory.                                                                                                                                                                                                                                                                                         |
| 6          | To TOP*               | Provide either <i>true</i> or <i>false</i> . If user selects: <ul style="list-style-type: none"> <li><i>true</i> row is added at the top.</li> <li><i>false</i> row is added at the bottom.</li> </ul>                                                                                                                                                                         |

| Output Tab: |                |                                                                                                      |
|-------------|----------------|------------------------------------------------------------------------------------------------------|
| No.         | Field Name     | Description                                                                                          |
|             | Output Fields: |                                                                                                      |
| 1           | Row ID         | Output field to hold the result of the successful plugin execution.<br>Default value: <i>RowID</i> . |

## 42.3 Smartsheet: Create Sheet In Folder

### 42.3.1 Description

Smartsheet: Create Sheet In Folder step creates a sheet in the Smartsheet folder.

| 3           | Get Fields        | Click to get all fields from the Smartsheet instance.                                 |

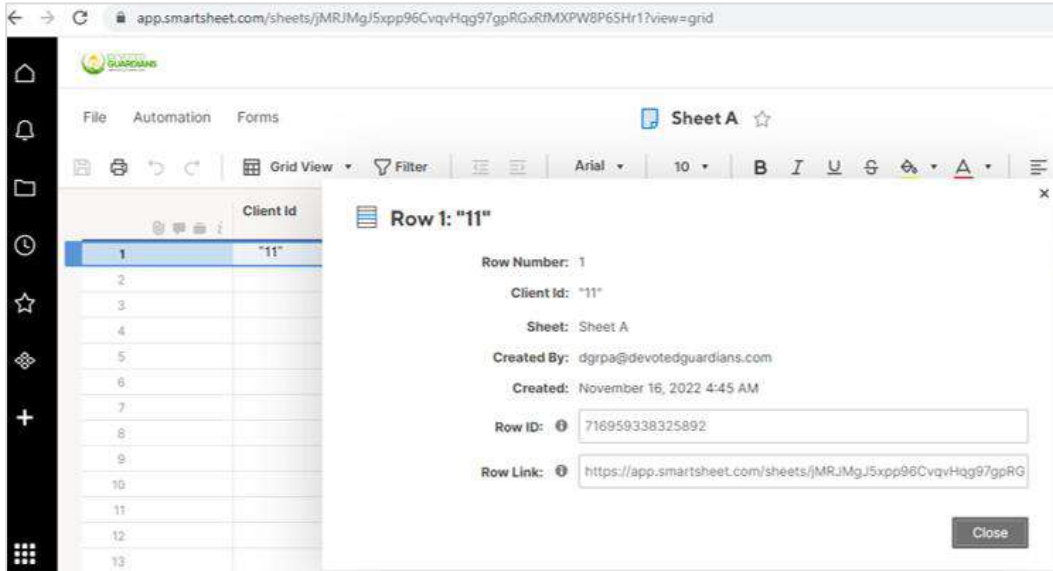

## 42.5 Smartsheet: Update Cell

### 42.5.1 Description

Smartsheet: Update Cell step updates content in the specified cell of Smartsheet.

**Note:**

- To get the row ID, click on Serial number cell → Click (i) in the Row Menu → Select Properties → Copy the Row ID.

- Execute the following API in the Postman and get the Column IDs from the response.  
**API URL:** <https://api.smartsheet.com/2.0/sheets/{SmartSheetID}>

**References:**

<https://smartsheet.redoc.ly/#operation/update-rows>

| 5          | Table fields          | Provide the details in the Table fields if you did not select the checkbox.                                                                                                                                                                                                                                                                                     |
| 5.a        | Variable Field Name   | This field is an optional field that accepts the value from the previous field or run-time parameters.                                                                                                                                                                                                                                                          |
| 5.b        | Static Field Name     | On click in the input table, fields associated with the module name will populate.                                                                                                                                                                                                                                                                              |
| 5.c        | Field Values          | Value of the respective field associated with the field name.<br>This field is mandatory.                                                                                                                                                                                                                                                                       |
| 6          | Row ID*               | Select the row you want to update.<br>This field is mandatory.                                                                                                                                                                                                                                                                                                  |
| 7          | Get                   | Click to populate the list of Row Id in the Smartsheet.                                                                                                                                                                                                                                                                                                         |

## 43 SolarWinds

Solar Winds is a NOC monitoring tool

The steps of this plugin have been tested on SolarWinds Orion SAM 6.6 for Server and Application Monitoring (SAM)

Prerequisites:

Solarwinds instance and access details.

Running Solarwinds-Orion-SAM-6.6 instance with valid access details.

## 43.1 Get Alerts

### 43.1.1 Description

The plugin is designed to get alerts of particular type either All Alerts or only Active Alerts.

Prerequisites: Solarwinds instance and access details

### 43.1.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                          |
|     | Connection:                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2   | Server Name                               | Provide the Solarwinds instance name/IP/hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|     | Port                                      | The port number of the Solarwinds instance should be provided. Port number should only be an integer.                                                                                                                                                                                                                                                                                                                                                                                       |
| 3   | Username                                  | The username of Solarwinds instance to authenticate.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                   |
| 5   | Password                                  | The Password to the username to authenticate. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |

| Input: |                    |                                                                  |

|        | Input:             |                                                                  |
| 1      | Alert Type(String) | Select Alert Type either All or Active. This field is mandatory. |

|   |                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Button: Get Fields | Clicking on this button populates Alerts fields/attributes of the particular selected Alert Type in the 'Field Name' Field in the table below.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 3 | Field Name(String) | <p>The name of the particular field/attribute that has to be fetched should be selected. Multiple fields can be selected from the list displayed on click. The selected fields will be the output parameters of this plugin. Choosing at least one field/attribute is mandatory.</p> <p>(e.g. for Active Alerts we could fetch fields/attributes such as, AlertActiveID, AlertObjectID, Acknowledged, AcknowledgedBy, AcknowledgedDateTime, AcknowledgedNote:, TriggeredDateTime, TriggeredMessage, NumberOfNotes, LastExecutedEscalationLevel</p> <p>(e.g. for All Alerts we could fetch fields/attributes such as, AlertObjectID, AlertID, EntityUri, EntityType, EntityCaption, EntityDetailsUri, EntityNetObjectId, RelatedNodesUri, RelatedNodeUrl, RelatedNodeId, RelatedNodeDetailsUri, RelatedNodeCaption, RelatedEntityUri, RelatedEntityType, TriggeredCount, LastTriggeredDateTime, Context, AlertNode etc.)</p> |

**NOTE:-**

1. Get Fields button does not work for the previous step fields. The button only works with static values and environment variables.
2. Every time the "Alert Type field changes. The "Get Fields" button needs to be clicked and the field list needs to be updated accordingly.

## 43.2 Get Nodes

The plugin is designed to get nodes configured on SolarWinds.

Prerequisites: SolarWinds instance and access details.

### 43.2.1 Configurations

| No. | Field Name  | Description                                                        |
|-----|-------------|--------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|     | Connection: |                                                                    |
| 2   | Server Name | Provide the Solarwinds instance name/IP/hostname.                  |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|---|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Port                                      | The port number of the Solarwinds instance should be provided. Port number should only be an integer.                                                                                                                                                                                                                                                                                                                                                                                              |
| 3 | Username                                  | The username of Solarwinds instance to authenticate.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|   | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                          |
| 5 | Password                                  | <p>The Password to the username to authenticate. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |

| Input: |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.    | Field Name          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|        | Input:              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| 1      | Button: Get Fields  | Clicking on this button populates fields/attributes in the 'Field Name' Field in the table below for all the Server and Application Nodes.                                                                                                                                                                                                                                                                                                                           |
| 2      | Field Name (String) | <p>The name of the particular field/attribute that has to be fetched should be selected in the table. Multiple fields can be selected from the list displayed above upon click. The selected fields will be the output parameters of this plugin. Choosing at least one field/attribute is mandatory.</p> <p>(e.g. for Nodes we could fetch fields/attributes such as, NodeID, NodeName, DisplayName, Category, NodeDescription, IP Address to name just a few.)</p> |
|        |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Note:-**

1. Get Fields button does not work for the previous step fields. The button only works with static values and environment variables.
2. Every time the "Get Fields" button needs to be clicked and the field list needs to be updated accordingly.

## 43.3 Acknowledge Alerts

### 43.3.1 Description

The plugin is designed to Acknowledge Alerts.

Prerequisites: Solarwinds instance and access details.

### 43.3.2 Configurations

| No. | Field Name                                | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|-----|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                                 | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                          |
|     | Connection configuration:                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 2   | Server Name                               | Provide the Solarwinds instance name/IP/hostname.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 3   | Port                                      | The port number of the Solarwinds instance should be provided. Port number should only be an integer.                                                                                                                                                                                                                                                                                                                                                                                       |
| 4   | Username                                  | The username of Solarwinds instance to authenticate.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|     | Password:                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 5   | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                   |
| 6   | Password                                  | The Password to the username to authenticate. Password is encrypted and not stored in the .psw file. Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. |

| Input: |               |                                                                             |
|--------|---------------|-----------------------------------------------------------------------------|
| No.    | Field Name    | Description                                                                 |
|        | Input:        |                                                                             |
| 1      | AlertObjectID | AlertObjectID of the alert to be acknowledged. This field is not mandatory. |

|   |                          |                                                                                                   |
|---|--------------------------|---------------------------------------------------------------------------------------------------|
| 2 | Button: GetAlertObjectID | Clicking on this button populates the AlertObjectID's of the Alerts. This field is not mandatory. |
| 3 | Acknowledge <b>Note:</b> | Acknowledge <b>Note:</b> for the alert to be acknowledged. This field is not mandatory.           |

**Note:-**

3. Get Fields button does not work for the previous step fields. The button only works with static values and environment variables.
4. Every time the "Get Fields" button needs to be clicked and the field list needs to be updated accordingly.

**Output:**

| No. | Field Name | Description                                                                                                                                                                                         |
|-----|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Result     | This is an output field to hold the result of the successful plugin execution (AlertObjectID has been handled successfully).<br>Default Value is "Result" when no values for this field are passed. |

## 43.4 Execute SWQL Query

The plugin is designed to execute Solarwinds SWQL queries

**Prerequisites:**

In addition to the general prerequisites mentioned at SolarWinds plugin level, SWQL studio.

### 43.4.1 Configurations

| No. | Field Name  | Description                                                                                           |
|-----|-------------|-------------------------------------------------------------------------------------------------------|
| 1   | Step Name   | Name of the step. This name has to be unique in a single workflow.                                    |
|     | Connection: |                                                                                                       |
| 2   | Server Name | Provide the Solarwinds instance name/IP/hostname.                                                     |
| 3   | Port        | The port number of the Solarwinds instance should be provided. Port number should only be an integer. |
| 4   | Username    | The username of Solarwinds instance to authenticate.                                                  |
|     | Password:   |                                                                                                       |

|   |                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | Checkbox: Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                 |
| 6 | Password                                  | <p>The Password to the username to authenticate. Password is encrypted and not stored in the .psw file.</p> <p>Password is entered using a widget. The widget handles both Text Var(static value or environment variable) and Combo(drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.</p> |
|   | Button:                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| 7 | Test Connection                           | <p>Test connection with username and password provided. Verifies whether the connection is available or not.</p> <p>Server name, Port number, username and password are mandatory.</p> <p><b>Note:</b> Test Connection Button does not work if the connection fields are populated from previous steps.</p>                                                                                                                                                                                               |

| Input Tab: |              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## 44 TOPdesk

TOPdesk plugin steps have been designed to perform tasks in an instance of TOPdesk server.

### Prerequisite

- TOPdesk instance with valid credentials.
- Valid Application Password (Token) generated from TOPdesk instance.
- Valid Admin and Supervisor SaaS permissions to generate application passwords and to perform necessary operations.

### 44.1 TOPdesk: Download Attachments

#### 44.1.1 Description

TOPdesk: Download Attachments will download attachments associated with a TOPdesk incident.

#### Reference URL

## 44.3 TOPdesk: Upload Attachment

### 44.3.1 Description

TOPdesk: Upload Attachment uploads an attachment for an incident on a specified TOPdesk incident.

**Note:**

- The step does not support custom fields and other fields, such as phone number, mobile number, and email because the Metadata API call which provides the field details is not available. Field metadata is required to prevent hardcoding and develop a plugin step generically.
- Some Display Values on UI are not the same as that of Logical values in API. For example, the display value on UI for the Category field is Software but the Logical value (API) for that field (Category) is Software specific.

| 1               | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2               | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

## 45 Twilio

Twilio Plugin can be used for perform communication functions using Twilio Cloud Communications platform. Twilio allows software developers to programmatically make and receive phone calls, send and receive text messages, and perform other communication functions.

### Prerequisites:

- Twilio instance with access details.
- Twilio API Credentials which includes, Account SID and Auth Token.

© 2023 AutomationEdge Inc All Rights Reserved.

This document is for your company's internal use only and may not be distributed to any third party.

- Twilio account with a sender number and appropriate access.

## Trial Instance

In case you wish to get started with Trial instance

- You may obtain Trial API Credentials to begin with on [www.twilio.com](http://www.twilio.com).
- In the General tab under Settings scroll to look for API Credentials.

- For prerequisites and appropriate access to send SMS using Twilio's Trial Account refer to the following URL: <https://support.twilio.com/hc/en-us/articles/223134087-Twilio-s-Global-SMS-on-trial-accounts>

## 45.1 Send SMS

### 45.1.1 Description

Twilio: Send SMS Plugin step sends a new outgoing message from Twilio phone number to an outside phone number.

### 45.1.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-----|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                               |
|     | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2   | Account SID                     | Specify 'Account SID' of a Twilio project that acts as a username.<br>Account SID is used in URL as username parameter of REST call to send SMS. Error messages for invalid Account SID may vary.                                                                                                                                                                                                                                                                |
|     | Auth Token:                     | Auth Token is the authentication for the Twilio project.                                                                                                                                                                                                                                                                                                                                                                                                         |
| 3   | Accept value as variable/static | Leave checkbox unchecked to accept Auth Token from a field in the previous steps of the stream using a drop down list.<br>Else enable checkbox for Auth Token field to appear as Text box.                                                                                                                                                                                                                                                                       |
| 4   | Auth Token                      | Specify the Auth Token of Twilio project/ that acts as a password.<br><br>If checkbox above is enabled Auth Token field appears as Text box and accepts static or variable values.<br>Else if checkbox above is disabled Auth Token field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.<br>This field data type is String. This field is mandatory. |

| No.         | Field Name  | Description                                                                                                         |
| 1           | JSON Output | Specify the output field to hold the result of the successful plugin execution.<br>Default value: <i>JSONOutput</i> |

**47 VMWare**

VMWare Plugin can be used for managing VMware vSphere - vCenter server.

**Compatibility:** vSphere Web Client (Version 6.5.0.13000 Build 8024368)

**Prerequisites:**

© 2023 AutomationEdge Inc All Rights Reserved.  
This document is for your company's internal use only and may not be distributed to any third party.

- vCenter Server with access details (Login credentials to authenticate VMware-vCenter server, vCenter port number)
- VMware certificate must be installed on the system where the plugin step needs to be executed. For the steps to install the certificate, refer [Appendix 8: Install VMware certificate](#).

## Get VM UUID, Resource ID, Target ID

### Get VM UUID

- In most VMWare Plugin steps when you work on existing VMs you have to specify the VM Name or UUID.
  - VM Name/UUID can be fetched from vSphere vCenter. Login to vCenter server GUI,
  - Navigate to vCenter Host (in which VM is created) → Virtual Machines Tab containing tabular information of the VMs including VM Name.
  - In case VM UUID is not visible in the table,
    - Right Click on any column header
    - Click on the 'Show/Hide Columns' option and
    - Select UUID column to be displayed with each of the VM Name.
  - UUID is now visible in the table. You may fetch this UUID to use in the Plugin steps.

### Get Compute Resource ID

- To find the 'Compute Resource ID', click on a Compute Resource (Host/Cluster/ResourcePool/vApp) on vSphere-vCenter and then click in the URL address bar.

Scroll the URL in the address bar to copy the 'Compute Resource ID' in between '%253A' (which is preceded by the Compute Resource Type) and a '~'.

Compute Resource Type preceding '%253A' is from one of the following.

- HostSystem,
- ClusterComputeResource,
- ResourcePool,
- VirtualApp

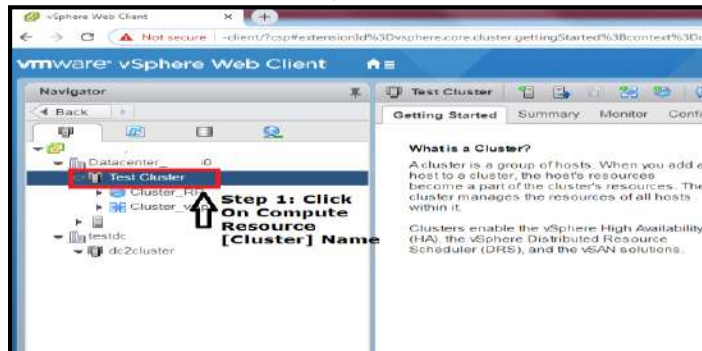

Following are samples of Resource ID marked in yellow. **Note:** that Resource ID is preceded by a %253A and followed by a ~. %253A must be which preceded by the desired Resource Type.

You may copy the Compute Resource ID required as marked in yellow below.

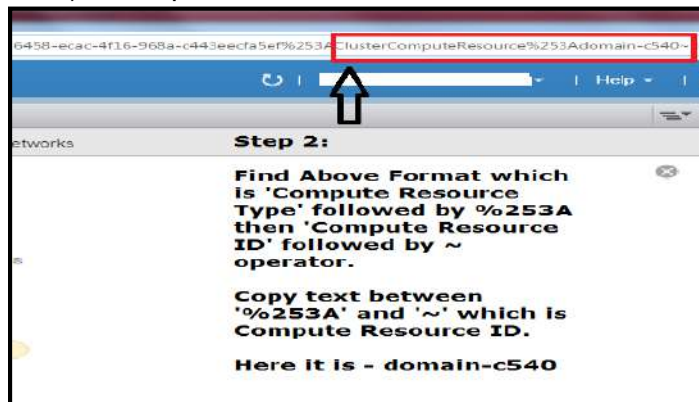

|              |                                |
|--------------|--------------------------------|
| Host ID      | HostSystem%253Ahost-528~       |
| Cluster:     | HostSystem%253Ahost-528~       |
| ResourcePool | ResourcePool%253Aresgroup-545~ |
| vApp:        | ResourcePool%253Aresgroup-545~ |

The following screen shots depict how to get the Compute Resource ID of a Cluster Resource Type.

- i. Select a cluster in the vSphere-vCenter as seen below.

- ii. Once the Resource Type i.e. Cluster in this case is selected scroll the URL address bar to locate the Resource Type (ClusterComputeResource in this case). Then pick the Resource ID in between %253A and a ~.

### Get Target ID

- To find the 'Target ID', click on a Target Location Type (Datacenter/VM Folder) on vSphere-vCenter and then click in the URL address bar.

Scroll the URL in the address bar to copy the 'Target ID' in between ' %253A ' (which is preceded by the Target Location Type) and a '~'.

Target Location Type preceding ' %253A ' is from one of the following.

- Datacenter
- VM Folder

Following are samples of Target ID marked in yellow. **Note:** that Target ID is preceded by a %253A and followed by a ~. %253A must be which preceded by the desired Target Location Type. You may copy the Target ID required as marked in yellow below.

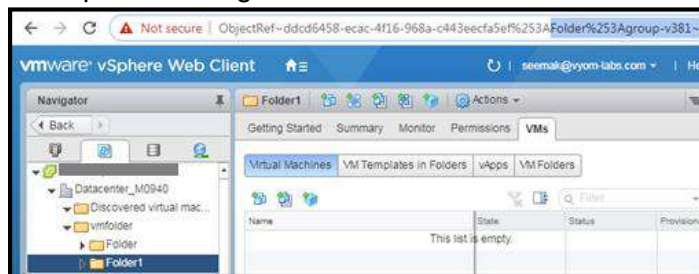

|            |                               |
|------------|-------------------------------|
| Datacenter | Datacenter%253Adatacenter-21~ |
| VM Folder  | Folder%253Agroup-v381~        |

The following screen shots depict how to get the Target ID of a Datacenter Target Location Type.

- iii. Select a Datacenter in the vSphere-vCenter as seen below.
- iv. Once the Target Location Type, i.e. Datacenter in this case is selected scroll the URL address bar to locate the Target Location Type (Datacenter in this case). Then pick the Target ID in between %253A and a ~.

- v. Similarly, once the Target Location Type i.e. VM Folder is selected scroll the URL address bar to locate the Target Location Type (Folder in this case). Then pick the Target ID in between %253A and a ~ as seen below.

Following is the list of VMWare Plugin steps,

## 47.1 VMware: Convert Template to VM

VMware: Convert Template to VM plugin step converts a template to a virtual machine.

### 47.1.1 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.                                                                                                          |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                |
| 5   | Password                        | Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state. |
| 6   | Button: Test Connection         | Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                                                                                   |

| Input Tab: |                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | Input Fields:            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 1          | Template Name            | <p>Specify the Name of an existing Template to be converted to a Virtual Machine.</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• If two or more templates with the same name appear in the vCenter Server inventory, then at the run time, the correct template object may not be used among duplicate template names. To resolve this issue, rename the duplicate template to a unique name for each entity</li> <li>• If Template name contains '%' special character then to execute the plugin step, provide Template name by replacing '%' character with '%25'</li> </ul> |
| 2          | Button: Get              | On click of this button, if the connection is successfully established it populates the list of Templates Names on the vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 3          | Compute Resource Type    | Specify compute resource type for converted VM. Allowed values: 'Cluster', 'Host', 'vApp', 'ResourcePool'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 4          | Compute Resource Name/ID | <p>Specify the Name/ID of a Compute Resource Type chosen above - for which the VM is to be created from template.</p> <p><b>Note:s:</b><br/>Refer <a href="#">Get Compute Resource ID</a></p> <p>in the VMWare Plugin introduction to get the 'Compute Resource ID'.</p>                                                                                                                                                                                                                                                                                                                          |
| 5          | Button: Get              | On click of this button, if the connection is successfully established it populates the list of computing resources based on the specified compute resource type.                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Common Buttons: |            |                                                                                                                                                                                                                                       |

| No.             | Field Name | Description                                                                                                                                                                                                                           |
|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.2 VMware: Convert VM to Template

VMware: Convert VM to Template plugin step converts a virtual machine to a template.

### 47.2.1 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> <ul style="list-style-type: none"> <li>If vCenter IP is given instead of vCenter server name, it may throw certificate error, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. In such a case vCenter IP entry must be present in the Subject Alternative Name field of the certificate.</li> </ul>                                           |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                |
| 5   | Password                        | Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state. |
| 6   | Button: Test Connection         | Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when                                                                                                                                                                                                                                                                                                                                      |

|  |                                                                                    |
|--|------------------------------------------------------------------------------------|
|  | workflow is in running state. Static values and environment variables are allowed. |
|--|------------------------------------------------------------------------------------|

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| No.             | Field Name | Description                                                                                                                                                                                                                           |
|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.3 VMware: Delete Snapshot

### 47.3.1 Description

VMware: Delete Snapshot plugin step deletes a specified snapshot optionally along with its child snapshots associated with a virtual machine.

### 47.3.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.                                                                                                          |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                |
| 5   | Password                        | Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state. |
| 6   | Button: Test Connection         | Verifies whether the connection is available or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|  |  |                                                                                                                                                                                                                   |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| 1          | Virtual Machine Name/UUID | <p>Specify the Name/UUID of the virtual machine to which the snapshot to be deleted is associated. The data type is String. This field is mandatory.</p> <p><b>Note:s:</b></p> <ul style="list-style-type: none"> <li>Refer <a href="#">Get VM UUID</a> in the VMWare Plugin introduction for steps to fetch the VM UUID.</li> <li>If two or more virtual machines with the same name appear in the vCenter Server inventory, then you may provide the UUID which is unique to each VM.</li> <li>If VM name contains '%' special character then to execute the plugin step, provide VM name by replacing '%' character with '%25'.</li> </ul> |
| 2          | Button: Get               | On click of this button, if the connection is successfully established it populates the list of Virtual Machine Names on the vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3          | Optional Input Fields:    | <b>Provide value for any one of the following only.</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|            | i Snapshot Created Date   | <p>Specify the Snapshot Created Date of a snapshot that is to be deleted in specified date format. Date Format: EEEE, MMMM dd, yyyy h:mm:ss a<br/>Date Example: Tuesday, November 26, 2019, 12:01:36 PM<br/>The data type is String. This field is optional.</p> <p><b>Note:</b><br/>Provide value in Snapshot Created Date or Snapshot Name but not both.</p>                                                                                                                                                                                                                                                                                |
|            | ii Button: Get            | On click of this button, if the connection is successfully established it populates the list of Snapshot Created Dates on the vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|            | iii Snapshot Name         | Specify the Snapshot Name to be deleted. The data type is String. This field is optional.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|   |    |                        |                                                                                                                                                                                                                                                 |
|---|----|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |    |                        | <p><b>Note:</b><br/>Provide value in Snapshot Created Date or Snapshot Name but not both.</p>                                                                                                                                                   |
|   | iv | Button: Get            | On click of this button, if the connection is successfully established it populates the list of Snapshot Names on the vCenter server.                                                                                                           |
| 4 |    | Delete Child Snapshots | <p>Allowed values: 'Yes' or 'No'.<br/>If given "Yes" then all the child snapshots of the specified snapshot will be deleted. If given blank, then no child snapshots will be deleted.<br/>The data type is String. This field is mandatory.</p> |

| Common Buttons: |            |                                                                                                                                                                                                                                       |
|-----------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                           |
|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.4 VMware: Delete All Snapshots

### 47.4.1 Description

VMware: Delete Snapshot plugin step deletes all Snapshots associated with a Virtual Machine on the specified vCenter server.

### 47.4.2 Configurations

| No. | Field Name     | Description                                                        |
|-----|----------------|--------------------------------------------------------------------|
| 1   | Step Name      | Name of the step. This name has to be unique in a single workflow. |
|     | Configuration: |                                                                    |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. |
| 2 | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                    |
| 3 | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                              |
|   | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                       |
| 5 | Password                        | Specify the password.<br>Password is entered using a widget. If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state. This field is mandatory.       |
| 6 | Button: Test Connection         | Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                          |

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                    |

|---|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                 | certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 2 | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 3 | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|   | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| 4 | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                                      |
| 5 | Password                        | Specify the password. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state. |
| 6 | Button: Test Connection         | Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                                                                                                         |

| Input Tab: |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|            | Input Fields: |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1          | Template Name | Name of an existing template to be used to create a new VM. 'Template Name' must be unique. The data type is String. This field is mandatory.<br><br><b>Note:</b> <ul style="list-style-type: none"> <li>If two or more templates with the same name appear in the vCenter Server inventory, then at the run time, the correct template object may not be used among duplicate template names. To resolve this issue, rename the duplicate template to a unique name for each entity</li> </ul> |

|    |                                         |                                                                                                                                                                                                                                          |
|----|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|    |                                         | <ul style="list-style-type: none"> <li>If Template name contains '%' special character then to execute the plugin step, provide Template name by replacing '%' character with '%25'</li> </ul>                                           |
| 2  | Button: Get                             | On click of this button, if the connection is successfully established it populates the list of Templates Names on the vCenter server.                                                                                                   |
| 3  | New Virtual Machine Name                | Name to be given to new virtual machine to be created.<br>Name of a new virtual machine to be created.<br>The data type is String. This field is mandatory.                                                                              |
| 4  | Target Location Type                    | Target location type to create a new VM. Allowed values: 'Datacenter', 'VM Folder'.<br>The data type is String. This field is mandatory.                                                                                                 |
| 5  | Target Location Name/ID                 | Target location name to create a new VM.<br>The data type is String. This field is mandatory.<br>Refer <a href="#">GetTargetID</a> <a href="#">Get Target ID</a><br>in VMWare Plugin introduction for the steps to fetch Target ID.      |
| 6  | Button: Get                             | On click of this button, if the connection is successfully established it populates the list of target locations based upon the specified target location type.                                                                          |
| 7  | Compute Resource Type                   | Compute resource type to create a new VM. Allowed values: 'Cluster', 'Host', 'vApp', 'ResourcePool'.<br>The data type is String. This field is mandatory.                                                                                |
| 8  | Compute Resource Name/ID                | Compute resource name to create a new VM.<br>The data type is String. This field is mandatory.<br><br><b>Note:s:</b><br>Refer <a href="#">Get Compute Resource ID</a><br>in VMWare Plugin introduction for the steps to fetch Target ID. |
| 9  | Button: Get                             | On click of this button, if the connection is successfully established it populates the list of computing resource names based upon the specified compute resource type.                                                                 |
| 10 | Datastore Name                          | Datastore name to create a new VM.<br>The data type is String. This field is mandatory.                                                                                                                                                  |
| 11 | Button: Get                             | On click of this button, if the connection is successfully established it populates the list of datastore names on the vCenter server.                                                                                                   |
| 12 | Power On Virtual Machine After Creation | Allowed values: 'Yes' or 'No'.<br>If "Yes" then VM will be powered-on after creation. If given "No" then VM power status is off after creation.<br><br>The data type is String. This field is mandatory.                                 |

| Common Buttons: |            |                                                                                                                                                                                                                                       |
|-----------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                           |
|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.6 VMware: Get VM Properties

### 47.6.1 Description

VMware: Get VM Properties plugin step fetches the properties of a virtual machine.

### 47.6.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                              |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 2   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. |
| 3   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                    |
| 4   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                              |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                    |
| 5   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                       |

|   |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6 | Password                | <p>Specify the password. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.</p> |
| 7 | Button: Test Connection | <p>Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                                         |

| 1             | Virtual Machine Name/UUID | <p>Specify the Name/UUID of the virtual machine to fetch the properties. The data type is string. This field is mandatory.</p> <p><b>Note:s:</b></p> <ul style="list-style-type: none"> <li>Refer <a href="#">Get VM UUID</a> in the VMWare Plugin introduction for steps to fetch the VM UUID.</li> <li>If two or more virtual machines with the same name appear in the vCenter Server inventory, then you may provide the UUID which is unique to each VM.</li> <li>If VM name contains '%' special character then to execute the plugin step, provide VM name by replacing '%' character with '%25'.</li> </ul> |
| 2             | Button: Get               | <p>On click of this button, if the connection is successfully established it populates the list of Virtual Machine Names on the vCenter server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Ouput Tab     |            |             |
|---------------|------------|-------------|
| No.           | Field Name | Description |
| Input Fields: |            |             |

|   |                       |                                                                                                                                                                                                                                      |
|---|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Accept Output as JSON | Enable checkbox to fetch property values as JSON output. Leave this unchecked to fetch Properties and their values as a tabular output fields.                                                                                       |
| 2 | JSON Output           | Specify an output field name to hold all of the VM properties and their values in JSON format.                                                                                                                                       |
|   | Output Table Fields:  | If 'Accept Fields as JSON' is not selected then the fields in this table are mandatory.                                                                                                                                              |
| 3 | Field Name            | On click of the cell in the output table, if the connection is successfully established it populates the list of VM properties. Select one or more properties as rows of the table. The data type is string. This field is optional. |
| 4 | Output Field          | Specify an output field in each row to hold the returned values of the properties selected in the Field Name column.                                                                                                                 |

| Common Buttons: |            |                                                                                                                                                                                                                                       |
|-----------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                           |
|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.7 VMware: Increase Hard Disk Size

VMware: Increase Disk plugin step increases the hard disk size of a virtual machine on the specified vCenter server.

### 47.7.1 Configurations

| No. | Field Name     | Description                                                        |
|-----|----------------|--------------------------------------------------------------------|
| 1   | Step Name      | Name of the step. This name has to be unique in a single workflow. |
|     | Configuration: |                                                                    |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | vCenter Server Base URL         | <p>Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)</p> <p><b>Note:</b></p> <ul style="list-style-type: none"> <li>• If vCenter IP is given instead of vCenter server name, it may throw certificate error, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. In such a case vCenter IP entry must be present in the Subject Alternative Name field of the certificate.</li> <li>• Two or more virtual machines with the same name appear in the vCenter Server inventory. In this scenario, at the run time, the correct virtual machine object may not be used among duplicate virtual machine names. To resolve this issue, rename the duplicate virtual machine to a unique name for each entity.</li> </ul> |
| 2 | Port                            | <p>Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 3 | Username                        | <p>Specify a Username to authenticate vCenter server.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.8 VMWare: Modify CPU Count

### 47.8.1 Description

VMware: Modify CPU Count Plugin step modifies the count of CPUs in a virtual machine.

### 47.8.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.                                                                                                          |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                             |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                |
| 5   | vCenter Password                | Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state. |
|     | Button: Test Connection         | Verifies whether the connection is available or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|  |  |                                                                                                                                                                                                                   |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |  | For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. |
|--|--|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|-----------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.             | Field Name | Description                                                                                                                                                                                                                           |
|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.9 VMWare: Modify CPU Properties

### 47.9.1 Description

VMware: Modify CPU Properties Plugin step modifies the CPU-related settings of a virtual machine.

#### Additional Prerequisites:

- The virtual machine should be powered off before executing this step. (If the virtual machine is powered on, this step does not provide any error and the changes will not be reflected after the execution of the step.)

### 47.9.2 Configurations

| No. | Field Name              | Description                                                                                                                             |
|-----|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name               | Name of the step. This name has to be unique in a single workflow.                                                                      |
|     | Configuration:          |                                                                                                                                         |
| 1   | vCenter Server Base URL | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: <a href="https://vmware.example.com">https://vmware.example.com</a> ) |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                 | <p><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.</p>                                                                                                                                                                                                           |
| 2 | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3 | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|   | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                       |
| 5 | vCenter Password                | <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.</p> |
|   | Button: Test Connection         | <p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                            |

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                |
|------------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name                | Description                                                                                                                                                                                                                                                                                                    |
|            | Input Fields:             |                                                                                                                                                                                                                                                                                                                |
| 1          | Virtual Machine Name/UUID | <p>Specify the Name/UUID of the virtual machine to modify properties. This field data type is String. This field is mandatory.</p> <p><b>Note:s:</b></p> <ul style="list-style-type: none"> <li>Refer <a href="#">Get VM UUID</a> in the VMWare Plugin introduction for steps to fetch the VM UUID.</li> </ul> |

|   |                        |                                                                                                                                                                                                                                                                                                                                                   |
|---|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                        | <ul style="list-style-type: none"> <li>If two or more virtual machines with the same name appear in the vCenter Server inventory, then you may provide the UUID which is unique to each VM.</li> <li>If VM name contains '%' special character then to execute the plugin step, provide VM name by replacing '%' character with '%25'.</li> </ul> |
| 2 | Button: Get            | <p>On click of this button, if the connection is successfully established it populates the list of Virtual Machine Names on the vCenter server.</p> <p><b>Note:</b> If VM name contains '%' special character then on click of 'Get' button, the VM name is returned by replacing '%' character with '%25'. You may leave it like that.</p>       |
| 3 | Cores Per Socket       | Specify the new number of cores per socket. This field data type is integer. This field is mandatory                                                                                                                                                                                                                                              |
| 4 | Enable CPU Hot Add*    | Allowed values: 'Yes' or 'No'.<br>If 'Yes' is specified then 'CPU Hot Add' will be enabled.<br>If 'No' is specified then 'CPU Hot Add' will be disabled.                                                                                                                                                                                          |
| 5 | Enable CPU Hot Remove* | Allowed values: 'Yes' or 'No'.<br>If 'Yes' is specified then 'CPU Hot Remove' will be enabled.<br>If 'No' is specified then 'CPU Hot Remove' will be disabled.                                                                                                                                                                                    |

**\*Note:s:**

- Hot-adding multi core virtual CPUs are supported only with hardware version 8 virtual machines. Not all guest operating systems support CPU hot add and hot remove. You cannot use these settings if the guest is not supported.
- To use the CPU hot-add feature with hardware version 7 virtual machines, set the Number of cores per socket to 1.
- Ensure that the VMware Tools is installed on the virtual machine for enabling hot plug (add/remove) functionality with Linux guest operating systems. Ensure that the virtual machine has a guest operating system that supports CPU hot plug.
- You can set any number of Cores per Socket through this plugin step (uses REST API). But it will cause problems while powering on the virtual machine. Make sure the Cores Per Socket should not exceed the allowed limit.

## 47.10 VMWare: Modify Memory Property

### 47.10.1 Description

VMware: Modify Memory Property Plugin step enables or disables the memory hot add property of a virtual machine.

### 47.10.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                            |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: <a href="https://vmware.example.com">https://vmware.example.com</a> )<br><br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                  |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                            |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                     |
| 5   | vCenter Password                | Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox                                                                                                                                  |

|  |                         |                                                                                                                                                                                                                                                                           |
|--|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|  |                         | above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.                                                                               |
|  | Button: Test Connection | Verifies whether the connection is available or not.<br>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. |

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.11 VMWare: Modify Memory Size

### 47.11.1 Description

VMware: Modify Memory Size Plugin step modifies the available memory size of a virtual machine.

### 47.11.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                       |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                          |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error, because the certificate contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                             |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                       |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                             |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                |

|   |                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5 | vCenter Password        | <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.</p> |
|   | Button: Test Connection | <p>Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                                   |

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.12 VMWare: Power off VM

### 47.12.1 Description

VMware: Power Off VM plugin step powers off a powered-on or suspended virtual machine.

### 47.12.2 Configurations

| No. | Field Name | Description |
|-----|------------|-------------|
|-----|------------|-------------|

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|   | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1 | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error, because the certificate contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.                                                                                                                                                                                                                        |
| 2 | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3 | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|   | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                       |
| 5 | Password                        | <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.</p> |
| 6 | Button: Test Connection         | <p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                            |

| Input Tab: |                           |                                                                                                                                                  |

| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.13 VMWare: Power On VM

### 47.13.1 Description

VMware: Power On VM powers on a powered-off or suspended virtual machine.

### 47.13.2 Configurations

| No. | Field Name     | Description                                                        |
|-----|----------------|--------------------------------------------------------------------|
| 1   | Step Name      | Name of the step. This name has to be unique in a single workflow. |
|     | Configuration: |                                                                    |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error, because the certificate contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.                                                                                                                                                                                                                        |
| 2 | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3 | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|   | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                       |
| 5 | Password                        | <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.</p> |
| 6 | Button: Test Connection         | Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                                                                                                                                                                                                                                          |

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                       |
|------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name                | Description                                                                                                                                                                                                                                                                                           |
|            | Input Fields:             |                                                                                                                                                                                                                                                                                                       |

|                 | Buttons:   |                                                                                                                                                                                                                                       |
| 1               | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2               | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.14 VMware: Rename Snapshot

### 47.14.1 Description

VMware: Rename Snapshot plugin step is designed to rename snapshot associated with VM on specified vCenter server.

### 47.14.2 Configurations

| No. | Field Name              | Description                                                                                                                             |
|-----|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name               | Name of the step. This name has to be unique in a single workflow.                                                                      |
|     | Configuration:          |                                                                                                                                         |
| 1   | vCenter Server Base URL | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: <a href="https://vmware.example.com">https://vmware.example.com</a> ) |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                                 | <p><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.</p>                                                                                                                                                                                                           |
| 2 | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3 | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|   | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                       |
| 5 | Password                        | <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.</p> |
| 6 | Button: Test Connection         | <p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                            |

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name                | Description                                                                                                                                                                                                                                                                                                                                 |
|            | Input Fields:             |                                                                                                                                                                                                                                                                                                                                             |
| 1          | Virtual Machine Name/UUID | <p>Specify the Name/UUID of the virtual machine to which the snapshot to be deleted is associated.</p> <p>The data type is String. This field is mandatory.</p> <p><b>Note:s:</b></p> <ul style="list-style-type: none"> <li>Refer <a href="#">Get VM UUID</a> in the VMWare Plugin introduction for steps to fetch the VM UUID.</li> </ul> |

|   |                        |                                                                                                                                                                                                                                                                                                                                                                                             |

|   |                        | <ul style="list-style-type: none"> <li>If two or more virtual machines with the same name appear in the vCenter Server inventory, then you may provide the UUID which is unique to each VM.</li> <li>If VM name contains '%' special character then to execute the plugin step, provide VM name by replacing '%' character with '%25'.</li> </ul>                                           |
| 2 | Button: Get            | On click of this button, if the connection is successfully established it populates the list of Virtual Machine Names on the vCenter server.                                                                                                                                                                                                                                                |
| 3 | Optional Input Fields: |                                                                                                                                                                                                                                                                                                                                                                                             |
|   | i                      | <p>Snapshot Created Date</p> <p>Specify the Snapshot Created Date of a snapshot that is to be deleted in specified date format. Date Format: EEEE, MMMM dd, yyyy h:mm:ss a<br/>Date Example: Tuesday, November 26, 2019, 12:01:36 PM<br/>The data type is String. This field is optional.</p> <p><b>Note:</b><br/>Provide value in Snapshot Created Date or Snapshot Name but not both.</p> |
|   | ii                     | <p>Button: Get</p> <p>On click of this button, if the connection is successfully established it populates the list of Snapshot Created Dates on the vCenter server.</p>                                                                                                                                                                                                                     |
|   | iii                    | <p>Snapshot Name</p> <p>Specify the Snapshot Name to be deleted.<br/>The data type is String. This field is optional.</p> <p><b>Note:</b><br/>Provide value in Snapshot Created Date or Snapshot Name but not both.</p>                                                                                                                                                                     |
|   | iv                     | <p>Button: Get</p> <p>On click of this button, if the connection is successfully established it populates the list of Snapshot Names on the vCenter server.</p>                                                                                                                                                                                                                             |
| 8 | New Snapshot Name      | Specify the new name for the specified Snapshot.<br>The Snapshot Name must be unique.<br>The data type is String. This field is mandatory.                                                                                                                                                                                                                                                  |
| 9 | Snapshot Description   | Provide a short Description for Snapshot Rename.<br>The data type is String. This field is optional.                                                                                                                                                                                                                                                                                        |

**Note:**

Allowed combinations of values for the input fields viz., 'Snapshot Created Date' and 'Snapshot Name':

| No. | Snapshot Created Date | Snapshot Name |
|-----|-----------------------|---------------|
|-----|-----------------------|---------------|

|   |                  |                      |
|---|------------------|----------------------|
| 1 | <Valid DateTime> |                      |
| 2 |                  | <Valid SnapshotName> |

Common Buttons:

| No. | Field Name | Description                                                                                                                                                                                                                           |
|-----|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Buttons:   |                                                                                                                                                                                                                                       |
| 1   | OK         | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2   | Cancel     | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.15 VMware: Revert VM to Snapshot

VMware: Revert To Snapshot plugin step reverts a Virtual Machine to a specified snapshot of a virtual machine or to the latest (current) snapshot.

### 47.15.1 Configurations

| No. | Field Name              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name               | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|     | Configuration:          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1   | vCenter Server Base URL | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> <ul style="list-style-type: none"> <li>If vCenter IP is given instead of vCenter server name, it may throw certificate error, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. In such a case vCenter IP entry must be present in the Subject Alternative Name field of the certificate.</li> <li>Two or more virtual machines with the same name appear in the vCenter Server inventory. In this scenario, at the run time, the correct virtual machine object may not be used among duplicate virtual machine names. To resolve this issue, rename the duplicate virtual machine to a unique name for each entity.</li> </ul> |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                                                                                                                                    |
| 3 | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|   | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| 4 | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                                                       |
| 5 | Password                        | <p>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.</p> <p>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.</p> |
| 6 | Button: Test Connection         | <p>Verifies whether the connection is available or not.</p> <p>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.</p>                                                                                                                                                                                                                                            |

| Input Tab: |                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|            | Input Fields:             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1          | Virtual Machine Name/UUID | <p>Specify the Name/UUID of the virtual machine to revert to a snapshot.</p> <p>The data type is string. This field is mandatory.</p> <p><b>Note:s:</b></p> <ul style="list-style-type: none"> <li>Refer <a href="#">Get VM UUID</a> in the VMWare Plugin introduction for steps to fetch the VM UUID.</li> <li>If two or more virtual machines with the same name appear in the vCenter Server inventory, then you may provide the UUID which is unique to each VM.</li> <li>If VM name contains '%' special character then to execute the plugin step, provide VM name by replacing '%' character with '%25'.</li> </ul> |

|   |                                        |                                                                                                                                                                                                                                                                                                                                             |
|---|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Button: Get                            | <p>On click of this button, if the connection is successfully established it populates the list of Virtual Machine Names on the vCenter server.</p> <p><b>Note:</b> If VM name contains '%' special character then on click of 'Get' button, the VM name is returned by replacing '%' character with '%25'. You may leave it like that.</p> |
|   | Optional Input Fields:                 | <b>Provide any one of the following.</b>                                                                                                                                                                                                                                                                                                    |
| 3 | Snapshot Created Date                  | <p>Snapshot Created Date of a snapshot to revert.<br/>Date Format: EEEE, MMMM dd, yyyy h:mm:ss a<br/>Date Example: Tuesday, November 26, 2019, 12:01:36 PM<br/>The data type is string. This field is optional.</p>                                                                                                                         |
| 4 | Button: Get                            | <p>On click of this button, if the connection is successfully established it populates the list of Snapshot Created Dates on the vCenter server.</p>                                                                                                                                                                                        |
| 5 | Snapshot Name                          | <p>Specify Snapshot Name to revert VM to.<br/>'Snapshot Name' must be unique.<br/>The data type is string. This field is optional.</p>                                                                                                                                                                                                      |
| 6 | Button: Get                            | <p>On click of this button, if the connection is successfully established it populates the list of Snapshot Names on the vCenter server.</p>                                                                                                                                                                                                |
| 7 | Revert VM To Latest (Current) Snapshot | <p>Allowed Value: 'Yes'.<br/>If given "Yes" then a virtual machine will be reverted to the latest (current) snapshot state.<br/>If the field is blank, then 'No' is considered.<br/>The data type is string. This field is optional.</p>                                                                                                    |

**Note:**

Allowed combinations of values for the input fields viz., 'Revert VM To Snapshot Created Date', 'Revert VM To Snapshot Name' and 'Revert VM To Latest (Current) Snapshot' as depicted below.

As seen below only one of the following values can be provided.

| No. | Revert VM To Snapshot Created Date | Revert VM To Snapshot Name | Revert VM To Latest (Current) Snapshot |
|-----|------------------------------------|----------------------------|----------------------------------------|
| 1   | <Valid DateTime>                   |                            |                                        |
| 2   |                                    | <Valid Name>               |                                        |
| 3   |                                    |                            | <Yes>                                  |

**Common Buttons:**

| No. | Field Name | Description |
|-----|------------|-------------|
|-----|------------|-------------|

|   |          |                                                                                                                                                                                                                                       |
|---|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   | Buttons: |                                                                                                                                                                                                                                       |
| 1 | OK       | Click this button to check and save the field values. If any required field values are missing then it will display a validation error message else if all the required field values are provided then it will save the field values. |
| 2 | Cancel   | Click this button, to cancel the window and does not save any values.                                                                                                                                                                 |

## 47.16 VMWare: Shutdown VM

### 47.16.1 Description

VMware: Shutdown VM plugin step shuts down a virtual machine.

### 47.16.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                              |
|-----|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                       |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                          |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error, because the certificate contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                             |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                       |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                             |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                |
| 5   | Password                        | Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.                                                                                                            |

|   |                         |                                                                                                                                                                                                                                                                                                                     |
|---|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                         | If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state. |
| 6 | Button: Test Connection | Verifies whether the connection is available or not. For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed.                                              |

## 47.17 VMWare: Suspend VM

### 47.17.1 Description

VMware: Suspend VM plugin step suspends a virtual machine.

### 47.17.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-----|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                      |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                         |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error, because the certificate contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format.                                                                                |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                            |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                      |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                            |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                               |
| 5   | Password                        | Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to |

## 47.18 VMware: Take VM Snapshot

### 47.18.1 Description

VMware: Take VM Snapshot plugin step takes a snapshot of a virtual machine's state.

### 47.18.2 Configurations

| No. | Field Name                      | Description                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1   | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                              |
|     | Configuration:                  |                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 1   | vCenter Server Base URL         | Specify the vCenter Server Base URL to connect to vCenter. (e.g.: https://vmware.example.com)<br><b>Note:</b> If vCenter IP is given instead of vCenter server name, it throws certificate error if the vCenter IP entry is not present in the Subject Alternative Name field of the certificate, because the certificate mostly contains entry of vCenter server in FQDN (Fully Qualified Domain Name) format. |
| 2   | Port                            | Specify the vCenter server port. (Default port is 443). This field should be an integer and value should be less than 65536.                                                                                                                                                                                                                                                                                    |
| 3   | Username                        | Specify a Username to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                              |
|     | Password:                       | The password to authenticate vCenter server.                                                                                                                                                                                                                                                                                                                                                                    |
| 4   | Accept value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                       |
| 5   | Password                        | Specify the password. Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). This field is mandatory.<br><br>If checkbox above is enabled Password field appears as Text box and accepts static or variable values. Else if checkbox above is disabled Password field appears as a drop down to   |

|   |                         |                                                                                                                                                                                                                                                                           |
|---|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                         | select fields from previous steps. Please <b>Note:</b> that Field values can only be accessed when workflow is in running state.                                                                                                                                          |
| 6 | Button: Test Connection | Verifies whether the connection is available or not.<br>For the purpose of verification fields coming from previous steps are not allowed since field values can only be accessed when workflow is in running state. Static values and environment variables are allowed. |

| Input Tab: |                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## 48 Windows

Windows plugin has been designed to perform actions on a Windows machine.

### Compatibility:

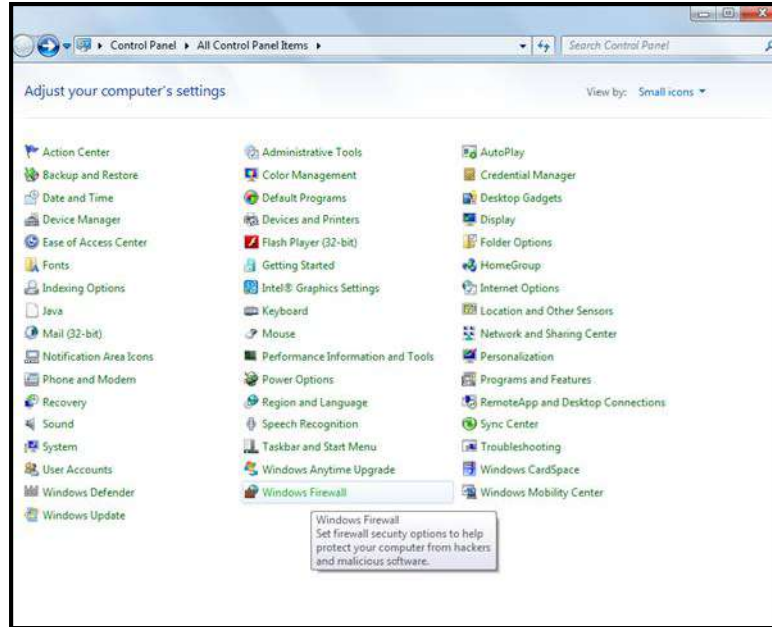

Windows 7, Windows Server 2008

### Prerequisites:

- Enable WinRM Protocol and set trusted host list value to \* on local as well as target system, refer [Appendix 6: Power Shell Remote Connection](#).
- WMI access on local and target machine (Required for Windows: Create Event Log, Restart Machine and Shutdown Machine steps). This is discussed below.
- PowerShell version 5 and above. This is discussed below.

Following are the steps to **provide WMI access on local and target machines**.

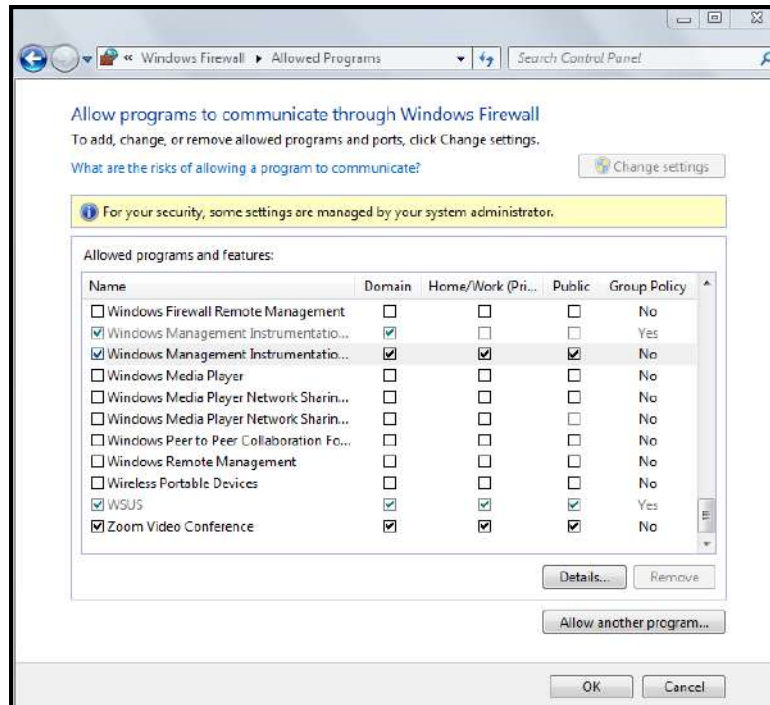

1. Under Control Panel click Windows Firewall

2. Click the link – Allow a program or feature through Windows Firewall.

3. Enable to allow Windows Management Instrumentation (WMI) at all levels as shown below.

Following are the steps to **setup Power Shell version 5 or above**,

#### A. Set PowerShell Execution Policy:

1. Open PowerShell command prompt in Run as administrator mode (Go to **Start**-> Search **PowerShell** -> Right Click on **Windows PowerShell** -> Click **Run as administrator option**)
2. Change execution policy of computer to allow running PowerShell scripts by using below:  
**command:** Set-ExecutionPolicy unrestricted -Force
3. Check if execution policy is changed by using below command:  
**command:** Get-ExecutionPolicy

#### B. Updating PowerShell Version:

1. **Download Windows Management Framework from below url: (to update to Windows PowerShell version 5.1 or higher)**

<https://www.microsoft.com/en-us/download/details.aspx?id=54616>

##### System requirements:

- WMF 5.1 requires Microsoft .NET Framework 4.5 or above. You can install Microsoft .NET Framework 4.5 or above by following the instructions at [Installing the .NET Framework](#).
- Use a 64-bit version of Windows.
- Need to restart machine once "Windows Management Framework 5.1" installation is completed.

**Note:** Open PowerShell by right clicking and select Run As Administrator

**2. Check if PowerShell version is updated to 5.1 or higher using below command:**

Command: `$PSVersionTable`

**Expected output:**

```

Name Value
---- -
PSVersion 5.1.14409.1005
PSEdition Desktop
PSCompatibleVersions {1.0, 2.0, 3.0, 4.0...}
BuildVersion 10.0.14409.1005
CLRVersion 4.0.30319.42000
WSManStackVersion 3.0
PSRemotingProtocolVersion 2.3
SerializationVersion 1.1.0.1

```

## 48.1 Windows: Get Disk Utilization

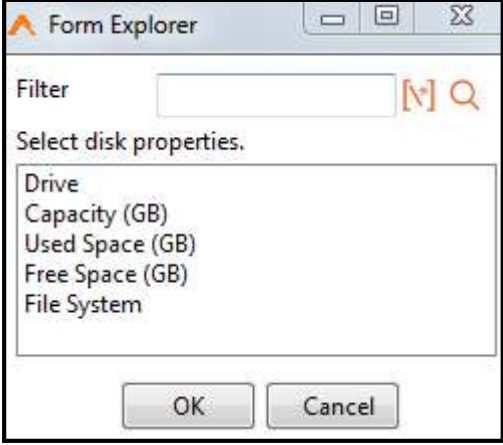

### 48.1.1 Description

Windows: Get Disk Utilization plugin step returns the utilization of logical disks on a local or remote windows machine. This is a row generating step.

### 48.1.2 Configurations

| Input Tab: |             |                                                                                                                                                                                                                                                                                  |

| No.        | Field Name  | Description                                                                                                                                                                                                                                                                      |
| 1          | Step Name   | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                               |
|            | Connection: |                                                                                                                                                                                                                                                                                  |
| 1          | Host        | Provide the Hostname/Server Name/Fully Qualified Domain Name (FQDN)/IP address of Windows machine.                                                                                                                                                                               |
| 2          | Username    | Specify the username of Windows account to authenticate. You may also provide username in the format <Domain name>\username or <Computer name>\username. However if you need to connect to a remote machine you need to provide <Domain name>\username. This field is mandatory. |
| 3          | Password    | Specify the Password of the Username. Password is stored in encrypted format in the AutomationEdge workflow file. This field is mandatory.                                                                                                                                       |

### Output Tab:

| No. | Field Name           | Description                                                                                                                                                                                                                                                                                       |
|-----|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Output Fields Table: |                                                                                                                                                                                                                                                                                                   |
| 1   | Property Name        | <p>Click this field to open a Form Explorer window with disk utilization properties. Property Name is mandatory.</p>  <p>Select Properties one by one in Property Name. At least one property is mandatory.</p> |
| 2   | Output Field         | Specify an output field to hold the result values for the property. The corresponding Output Field is mandatory.                                                                                                                                                                                  |

## 48.2 Windows: Get Service Status

### 48.2.1 Description

Windows: Get Service Status plugin step gets the status of a service on a local or remote computer.

### 48.2.2 Configurations

| Input Tab: |             |                                                                                                                                                                                                                                                                                   |

| 1          | Host                            | Provide the Hostname/Server Name/Fully Qualified Domain Name (FQDN)/IP address of Windows machine.                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3          | Username                        | Specify a Windows username to authenticate. You may also provide username in the format <Domain name>\username or <Computer name>\username. However if you need to connect to a remote machine you need to provide <Domain name>\username. This field is mandatory.                                                                                                                                                                                                                                    |
|            | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 3          | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.                                                                                                                                                                                                                                                                                                              |
| 4          | Password                        | Specify the Password of the Username. Password is stored in encrypted format in the AutomationEdge workflow file.<br><br>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. This field is mandatory. |
| 5          | Service Name                    | Specify the Windows Service Name of a paused service to be resumed. Only Windows services that have pause and resume options can be specified. This field is a String. The field is mandatory.                                                                                                                                                                                                                                                                                                         |

|  |  |                                                                                                                             |
|--|--|-----------------------------------------------------------------------------------------------------------------------------|
|  |  | Make sure to get the Windows Service name by right clicking on the service and clicking Properties. Copy the 'Service name' |
|--|--|-----------------------------------------------------------------------------------------------------------------------------|

## 48.7 Windows: Run DOS/PowerShell Commands

### 48.7.1 Description

Windows: Run DOS Commands plugin step executes DOS and PowerShell commands.

**Note:** This step is not a row generating step hence; it must be an intermediate step in a workflow.

### 48.7.2 Configurations

| Input Tab: |               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 1          | Step Name     | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|            | Input Fields: |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 1          | Session Name  | Select a previously created Session Name using Start DOS Session plugin step. For example, Windows: Start DOS/PowerShell Session.<br>This step should always be preceded with a Start DOS session plugin step to use a previously created session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 3          | Script Box    | Provide DOS or PowerShell commands or Script to execute. This data type is String. This field is mandatory.<br><br><b>Note:</b> <ul style="list-style-type: none"> <li>A combination of static values or variables and previous step field can be passed in the script box.</li> <li>If you are passing multiple rows to multiple Run DOS Commands steps then the steps are executed in parallel, to run them sequentially use Loop steps or Workflow executor step.</li> </ul><br><b>Known Issues:</b> <ul style="list-style-type: none"> <li>If the command needs manual intervention, then it may stay in an infinite execution state. To avoid this use parameterized commands or suitable silent switches.</li> <li>This step executes only those DOS commands which can be executed using PowerShell.</li> </ul> |
| 4          | Liner         | Shows cursor position in script box                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|   |                                    |                                                                                            |
|---|------------------------------------|--------------------------------------------------------------------------------------------|
| 5 | Max Wait For Response (In Seconds) | Provide timeout in seconds to execute the given command. The default value is 300 seconds. |
|---|------------------------------------|--------------------------------------------------------------------------------------------|

| Output Tab: |               |                                                                                                                                     |
|-------------|---------------|-------------------------------------------------------------------------------------------------------------------------------------|
| No.         | Field Name    | Description                                                                                                                         |
|             | Output Field: |                                                                                                                                     |
| 1           | Output        | It will provide the script output (provides combined output if the script contains multiple commands). The default text is 'Output' |

| Common Buttons: |            |                                                                                                                                                                                                                                  |

|   |                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|---|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box. The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                   |
| 4 | Password                        | Specify the password of the Windows Account. Password is encrypted and is not stored in the .psw workflow file.<br><br>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps. The data type is string. This field is mandatory. |
| 5 | Force Shutdown                  | Allowed values for Force Shutdown are “YES”, “NO”. The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 48.9 Windows: Start DOS / PowerShell Session

### 48.9.1 Description

Windows: Start DOS Session starts a DOS session.

This step is not a row generating step hence; it must be an intermediate step in a workflow.

### 48.9.2 Configurations

| Input Tab: |                                 |                                                                                                                                                                                                                                                                                      |

## 48.10 Windows: Stop DOS / PowerShell Session

### 48.10.1 Description

Windows: Stop DOS Session plugin step stops the provided running DOS session.

This step is not a row generating step hence; it must be an intermediate step in a workflow.

### 48.10.2 Configurations

| Input Tab: |               |                                                                                                                                                                                                                                                                                                                                                                                                  |

| 1 | Step Name                       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|   | Connection:                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 1 | Host                            | Provide the Hostname/Server Name/Fully Qualified Domain Name/IP address of Windows machine.<br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                 |
| 3 | Username                        | Specify the username of Windows account to authenticate.<br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                    |
|   | Password:                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 3 | Accept Value as variable/static | Leave checkbox unchecked to accept Password value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Password field to appear as Text box.<br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                   |
| 4 | Password                        | Specify the password of the Windows Account. Password is encrypted and is not stored in the .psw workflow file.<br><br>Password is entered using a widget. The widget handles both Text (static value or environment variable) and Combo (drop down containing values from previous steps). If checkbox above is enabled Password field appears as Text box. Else if checkbox above is disabled Password field appears as a drop down to select fields from previous steps.<br>The data type is string. This field is mandatory. |
| 5 | Service Name                    | Specify the Service Name to be stopped.<br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| 6 | Force Stop                      | Force Stop option. Allowed values are only “YES”, “NO”.<br>The data type is string. This field is mandatory.<br><br><b>Note:</b> In case of exception a windows Return value does not occur if Force Stop option is YES.                                                                                                                                                                                                                                                                                                         |

## 49 Zendesk

Zendesk plugin steps have been designed to perform tasks in an instance of Zendesk.

### Prerequisite

- Zendesk instance with valid credentials.
- Valid permissions
- Valid API Token found on Zendesk instance.

## Compatibility

- Process Studio 7.3, AutomationEdge 7.3

## Reference URLs

- [https://developer.zendesk.com/rest\\_api/docs/support/tickets](https://developer.zendesk.com/rest_api/docs/support/tickets)
- <https://support.zendesk.com/hc/en-us/articles/226022787-Generating-a-new-API-token->

## Limitations:

- **Non-availability of all ticket fields in APIs.**

URL/API: /api/v2/ticket\_fields.json

- Most of the default fields like id, tags, followers, requester, created-date, etc. are not available through the above API.
- As all fields are not returned, it is not possible to populate those field lists in the Create Ticket and Update Tickets plugin steps.
- Even if we try to provide hard-coded field names, the record cannot be inserted due to the non-availability of the data type of those fields.

- **Fields display name and fields internal name is different for few fields.**

For example, assignee - assignee\_id, group- group\_id, type - ticket\_type.

- **Inconsistency in the error response body.**

<https://vyomlabs4037.zendesk.com/api/v2/search.json?query=solved:2020-30-07>

### A. For unauthorized user

```
{
 "error": {
 "title": "Forbidden",
 "message": "You do not have access to this page. Please contact the account owner of this help desk for further help."
 }
}
```

### B. Invalid search criteria

```
{
 "error": "invalid",
 "description": "Invalid search: Illegal date value (yyyy-mm-dd expected): solved:2020-30-07"
}
```

### C. Incorrect Email or Token

```
{ "error": "Couldn't authenticate you"}
```

Due to such inconsistency, we need to handle it with a lot of custom code.

- **Values of option type fields are only accepted when passed in a small case in the request body.**
  - On the Zendesk form, the dropdown values of Type, Priority, and Status start with a capital case letter. But, in the APIs, those values are accepted ONLY in small case letters. Due to this, there are chances of getting a lot of Training type support tickets.
  - If wrong/ invalid value for lookup field such as Type, Priority, and Status is given, the API does not throw error. For example, { "priority": "High"}. In this case the API runs successfully however, the value does not get inserted/updated on UI.
- **For update tickets only those tickets searched, will get updated.**
- **Updating or getting the tickets will take a few minutes to get indexed, after which they will be available through API.**

## 49.1 Zendesk: Create Ticket

### 49.1.1 Description

Zendesk: Create Ticket step creates a new ticket on the specified Zendesk instance.

### 49.1.2 Configurations

| General Tab: |                                   |                                                                                                                                                                                                                                                       |

## 49.4 Zendesk: Get Tickets

### 49.4.1 Description

Zendesk: Get Tickets step gets the tickets matching the criteria query.

#### Limitations:

- All ticket fields are not visible in the get ticket fields list.
- If you provide incorrect or invalid values in the lookup fields or custom lookup fields, the API does not throw an error.
- The tickets do not come in sequence.
- Update Ticket: Only those records are updated that are searched.

|--------------|------------|-------------|
| No.          | Field Name | Description |

|   |                 |                                                                                                                                                                                                        |
|---|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Step Name       | Name of the step. This name has to be unique in a single workflow.                                                                                                                                     |
|   | Connection:     |                                                                                                                                                                                                        |
| 2 | Base URL        | Specify base URL of Zendesk server instance. For example, <a href="https://xxx.zendesk.com">https://xxx.zendesk.com</a> for on cloud instance<br><br>The data type is string. This field is mandatory. |
| 3 | Access Token    | Access token retrieved from OAuth token API call.                                                                                                                                                      |
| 4 | Test Connection | Click button to test the connection, if it is available or not.                                                                                                                                        |

| Input Tab: |                          |                                                                                                                                                                                                                                                                       |
|------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name               | Description                                                                                                                                                                                                                                                           |
| 1          | Criteria Query           | Fetch all Zendesk tickets matching the criteria query. For sample criteria query, see <a href="https://developer.zendesk.com/api-reference/ticketing/ticket-management/search/">https://developer.zendesk.com/api-reference/ticketing/ticket-management/search/</a> . |
| 2          | Fetch Records Batch Size | Specify the batches based on which the step will fetch the records.                                                                                                                                                                                                   |
| 3          | Get Top N Records        | Fetch the Top N records matching the criteria query.                                                                                                                                                                                                                  |

| Output Tab: |             |                                                                                                                         |
|-------------|-------------|-------------------------------------------------------------------------------------------------------------------------|
| No.         | Field Name  | Description                                                                                                             |
| 1           | JSON Output | Output field to hold the result of the successful plugin execution. Default label value for this field is "JSONOutput". |

## 49.5 Zendesk: Get Tickets Count

### 49.5.1 Description

Zendesk: Get Tickets Count step gets the tickets count matching the criteria query.

### 49.5.2 Configurations

| General Tab: |             |                                                                    |
|--------------|-------------|--------------------------------------------------------------------|
| No.          | Field Name  | Description                                                        |
| 1            | Step Name   | Name of the step. This name has to be unique in a single workflow. |
|              | Connection: |                                                                    |

|   |                                   |                                                                                                                                                                                                  |
|---|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Base URL                          | Specify base URL of Zendesk instance. For example, <a href="https://xxx.zendesk.com">https://xxx.zendesk.com</a> for on cloud instance.<br><br>The data type is string. This field is mandatory. |
|   | Token:                            |                                                                                                                                                                                                  |
| 3 | Accept Values as variable/ static | Leave checkbox unchecked to accept Token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Token field to appear as Text box.              |
| 4 | Access Token                      | Access token retrieved from OAuth token API call.                                                                                                                                                |
| 5 | Test Connection                   | Click to verify whether the connection is established or not.                                                                                                                                    |

#### Input Tab

|              | Connection:                       |                                                                                                                                                                                                    |
| 2            | Base URL                          | Specify base URL of Zendesk instance. For example, <a href="https://xxxx.zendesk.com">https://xxxx.zendesk.com</a> for on cloud instance.<br><br>The data type is string. This field is mandatory. |
|              | Token:                            |                                                                                                                                                                                                    |
| 3            | Accept Values as variable/ static | Leave checkbox unchecked to accept Token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Token field to appear as Text box.                |
| 4            | Access Token                      | Access token retrieved from OAuth token API call.                                                                                                                                                  |
| 5            | Test Connection                   | Click to verify whether the connection is established or not.                                                                                                                                      |

| Input Tab |                       |                                                                                                                                                                                                                                  |
|-----------|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.       | Field Name            | Description                                                                                                                                                                                                                      |
|           | Input Fields:         |                                                                                                                                                                                                                                  |
| 1         | Ticket ID             | Select ticket ID for which you want to update the tickets.                                                                                                                                                                       |
| 2         | Accept Fields as JSON | Enable checkbox to accept field names as JSON input. In the JSON text you can have dynamic fields to insert rather than static fields to be provided in the Table Fields. Leave this unchecked to provide Table Fields as input. |
| 3         | JSON                  | JSON text should contain key-value pairs enclosed by double quotes (") enclosure. Provide all the required or mandatory fields and other fields to be inserted as keys in the JSON.                                              |

|   |                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|   |                     | <p>If 'Accept Fields as JSON' checkbox is enabled, then this field is activated. Choose a field containing the JSON text.</p> <p>The data type is string. If 'Accept Fields as JSON' is selected this field is mandatory.</p> <p>Sample JSON key value pairs:<br/>The following sample contains one record. You may add more records in curly braces.</p> <pre>[   {     "subject": "My printer is on fire!",     "status": "open"   } ]</pre> |
| 4 | Form Name           | Select the name of the form to be selected to update the ticket.                                                                                                                                                                                                                                                                                                                                                                               |
| 5 | Get                 | Click to populate the list of form names on the Zendesk instance.                                                                                                                                                                                                                                                                                                                                                                              |
|   | Table Fields:       | If 'Accept Fields as JSON' is not selected then the fields in this table are mandatory.                                                                                                                                                                                                                                                                                                                                                        |
| 6 | Variable Field Name | Select values from previous fields in the stream/environment variables or variables. For example, run-time parameters for incident fields.                                                                                                                                                                                                                                                                                                     |
| 7 | Static Field Name   | On click of this cell, fields associated with the form (incident in this case) are displayed.<br><br><b>Note:</b> One of either Variable Field Name or Static Field Name must be provided. If both are provided then Static Field Name is taken.                                                                                                                                                                                               |
| 8 | Field Value         | Select valid updated values for the field associated with the field name.<br>The data type is string. This field is mandatory.                                                                                                                                                                                                                                                                                                                 |

| Common Buttons: |            |                                                                                                                                                                                                                                                   |

## 49.7 Zendesk: Upload Attachment

### 49.7.1 Description

Zendesk: Upload Attachment step uploads an attachment to an existing ticket on a Zendesk instance.

### 49.7.2 Configurations

| General Tab: |                                   |                                                                                                                                                                                                    |
|--------------|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.          | Field Name                        | Description                                                                                                                                                                                        |
| 1            | Step Name                         | Name of the step. This name has to be unique in a single workflow.                                                                                                                                 |
|              | Connection:                       |                                                                                                                                                                                                    |
| 2            | Base URL                          | Specify base URL of Zendesk instance. For example, <a href="https://xxxx.zendesk.com">https://xxxx.zendesk.com</a> for on cloud instance.<br><br>The data type is string. This field is mandatory. |
|              | Token:                            |                                                                                                                                                                                                    |
| 3            | Accept Values as variable/ static | Leave checkbox unchecked to accept Token value from a field in the previous steps of the stream using a drop down list. Else enable checkbox for Token field to appear as Text box.                |
| 4            | Access Token                      | Access token retrieved from OAuth token API call.                                                                                                                                                  |
| 5            | Test Connection                   | Click to verify whether the connection is established or not.                                                                                                                                      |

| Input Tab |               |                                                                                                           |
|-----------|---------------|-----------------------------------------------------------------------------------------------------------|
| No.       | Field Name    | Description                                                                                               |
|           | Input Fields: |                                                                                                           |
| 1         | Ticket ID     | Specify an existing ticket ID to upload the attachment. The data type is string. This field is mandatory. |
| 2         | File Name     | Specify the name of the file you want to upload. The data type is string. This field is mandatory.        |
|           | Button: Get   | Click to populate the file name field.                                                                    |
| 3         | Comment       | Specify a comment related to uploading an attachment.                                                     |

### Common Buttons:

| No. | Field Name | Description                                                                                                                                                                                                                                |
|-----|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|     | Buttons:   |                                                                                                                                                                                                                                            |
| 1   | OK         | On click of this button. It will check the field values. If any required field values are missing, then it will display validation error message.<br><br>If all the required field values are provided then it will save the field values. |
| 2   | Cancel     | On click of this button, it will cancel the window and do not save any values.                                                                                                                                                             |

## 50 ZohoDesk

### Prerequisite:

- Zoho Desk Account with Subscription with administrative access.
- Refresh Token should be known.

### Note:

**Access Token:** Using a Refresh Token a client can create up to 10 access tokens in a span of 10 minutes. If the limit is reached, the access token creation is blocked for 10 minutes.

### 50.1 Zoho Desk: Create Ticket

#### 50.1.1 Description

Zoho Desk: Create Ticket plugin step creates a new ticket on the specified Zoho Desk instance.

#### References:

|---|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Base URL                        | Specify a base URL of Zoho Desk instance.<br>The field data type is String. This is mandatory.                                                                                                                 |
| 3 | Client ID                       | Specify the client ID of Zoho Desk instance.<br>The field data type is String. This is mandatory.                                                                                                              |
| 4 | Client Secret                   | Specify the client secret of the Zoho Desk instance.<br>The field data type is String. This is mandatory.                                                                                                      |
| 5 | Accept value as variable/static | Leave checkbox unchecked to accept Refresh Token value from a field in the previous steps of the stream using a drop down list.<br>Else select the checkbox for the Refresh Token field to appear as Text box. |
| 6 | Refresh Token                   | Retrieve the refresh token from OAuth token API call.<br>The field data type is Secure String. This is mandatory.                                                                                              |
| 7 | Test Connection                 | Click Test Connection button to verify whether the connection is available or not.                                                                                                                             |

| Input tab: |            |                                                                                                                                                                                                                |
|------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No.        | Field Name | Description                                                                                                                                                                                                    |
| 1          | Ticket ID  | Specify the ticket ID for which you want to upload the attachment.<br>The field data type is String. This is mandatory.                                                                                        |
| 2          | File Name  | Specify the file which you want to upload on the ZohoDesk instance.<br>The field data type is String. This is mandatory.                                                                                       |
| 3          | Public     | Specify <i>true</i> or <i>false</i> . If a user provides: <ul style="list-style-type: none"> <li><i>true</i>: attachment is marked as Public</li> <li><i>false</i>: attachment is marked as Private</li> </ul> |
| 4          | Browse     | Click to bring up the dialog to select the Input file path.                                                                                                                                                    |

| Output tab: |               |                                                                                            |
|-------------|---------------|--------------------------------------------------------------------------------------------|
| No.         | Field Name    | Description                                                                                |
| 1           | Attachment ID | Holds the result of the successful plugin execution.<br>Default value: <i>AttachmentID</i> |

## IV. Appendices

# 1 Appendix 1: Error Handling in IT Plugins

This appendix describes Error Handling for IT plugins.

1. Upon Successful execution of steps in Process Studio a workflow completes successfully and any output fields data is displayed.

**Execution Results**

Execution History | Logging | Step Metrics | Performance Graph | Metrics | Preview data

First rows | Last rows | Off

|    | AlertActiveID | AlertObjectID | Acknowledged | AcknowledgedBy |
|----|---------------|---------------|--------------|----------------|
| 1  | 163           | 118           | <null>       | <null>         |
| 2  | 164           | 119           | <null>       | <null>         |
| 3  | 165           | 120           | true         | admin          |
| 4  | 166           | 121           | <null>       | <null>         |
| 5  | 167           | 122           | <null>       | <null>         |
| 6  | 168           | 123           | <null>       | <null>         |
| 7  | 169           | 124           | <null>       | <null>         |
| 8  | 170           | 125           | <null>       | <null>         |
| 9  | 171           | 126           | <null>       | <null>         |
| 10 | 172           | 127           | <null>       | <null>         |
| 11 | 973           | 224           | <null>       | <null>         |
| 12 | 1151          | 129           | <null>       | <null>         |

2. In case any step fails the workflow aborts.

**Execution Results**

Execution History | Logging | Step Metrics | Performance Graph | Metrics | Preview data

First rows | Last rows | Off

2018/06/23 11:43:38 - Get Alerts 2.0 - ERROR (version Unknown, build 0 from 2018/06/23 07:11:29.429 by Administrator) : java.net.ConnectException: Connection timed out: connect  
 2018/06/23 11:43:38 - Get Alerts 2.0 - Finished processing (I=0, O=0, R=1, W=0, U=0, E=1)

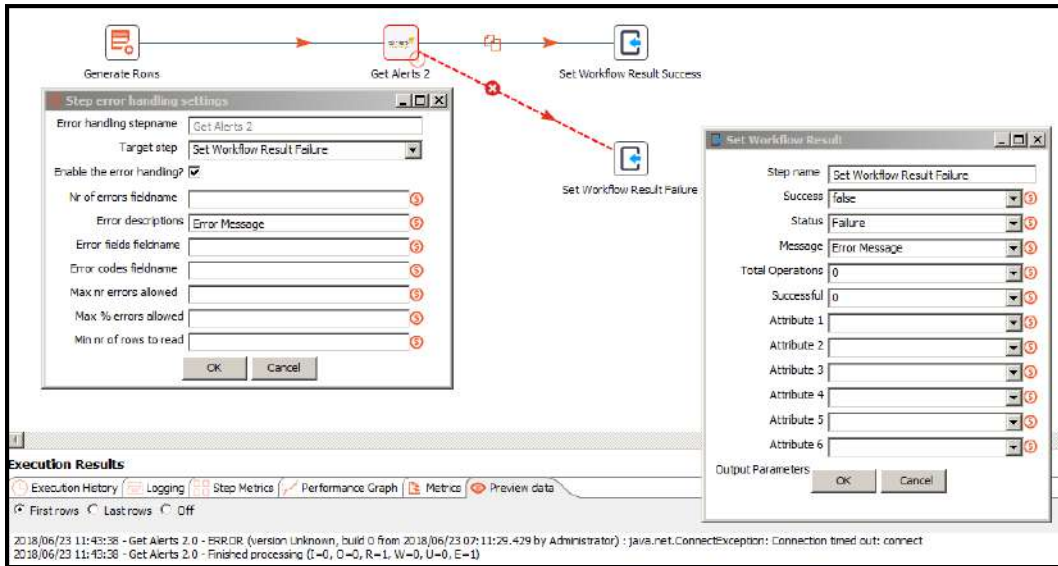

3. On AutomationEdge the Error Message displayed is- Workflow detected one or more steps with errors.

| Id | Workflow Name | Status  | Agent Name            | Created              | Completed Date       |
|----|---------------|---------|-----------------------|----------------------|----------------------|
| 40 | Alert1        | Failure | Administrator@LPT0540 | 23-Jun-2018 11:34:55 | 23-Jun-2018 11:34:58 |

Error! : Workflow detected one or more steps with errors.

4. To get the exact error message as displayed in Process Studio error handling needs to be done in the process studio workflow as shown below.
  - Add two Set Workflow Result steps as seen below, one for workflow success and the other one for error handling.

- Now right click the IT Plugin step (Alert) and provide a name for Error Descriptions field (In this case 'Error Message').
- In the Set Workflow Result Failure select this field, 'Error Message' from the Message drop down combo box.

5. If the workflow is now published on AutomationEdge and run, it displays the complete error message as shown below.

| Id | Workflow Name | Status  | Agent Name            | Created              | Completed Date       |
|----|---------------|---------|-----------------------|----------------------|----------------------|
| 42 | Alert1        | Failure | Administrator@LPT0540 | 23-Jun-2018 12:10:49 | 23-Jun-2018 12:11:12 |

**Error!** : java.net.ConnectException: Connection timed out: connect **Error Message** : java.net.ConnectException: Connection timed out: connect

## 2 Appendix 2: PowerShell Setup- Active Directory

### 2.1 Prerequisites for Active Directory on client machine

1. PowerShell Version 5 and above.
2. Active Directory role installed on Server Manager on targeted server
3. 'ActiveDirectory' module on localhost and AD server
4. Sufficient Privileges for Active Directory Server

### 2.2 Set PowerShell Execution Policy

1. Open PowerShell command prompt in Run as Administrator mode:  
Go to **Start-> Search PowerShell -> Right Click on Windows PowerShell -> Click Run as Administrator option**
2. Change execution policy of computer to allow running PowerShell scripts by using below: **command**: Set-ExecutionPolicy unrestricted -Force.

3. Check if execution policy is changed by using below command: **command:** Get-ExecutionPolicy.

## 2.3 Updating PowerShell Version

1. **Download Windows Management Framework from below url :(Windows PowerShell version 5.1)**

<https://www.microsoft.com/en-us/download/details.aspx?id=54616>

### System requirements:

WMF 5.1 requires Microsoft .NET Framework 4.5 or above. You can install Microsoft .NET Framework 4.5 or above by following the instructions at [Installing the .NET Framework.](#)

Use a 64-bit version of Windows. Support for the 32-bit version the Microsoft Azure Active Directory Module for Windows PowerShell was discontinued in October, 2014.

Need to restart machine once “Windows Management Framework 5.1 “installation is completed.

**Note:** Open PowerShell by right clicking and select Run As Administrator option and use below commands on that terminal to proceed with module installation.

2. **Check if PowerShell version is updated to 5.1 using below command:**

Command: \$PSVersionTable

### Expected output:

| Name                      | Value                   |
|---------------------------|-------------------------|
| PSVersion                 | 5.1.14409.1005          |
| PSEdition                 | Desktop                 |
| PSCompatibleVersions      | {1.0, 2.0, 3.0, 4.0...} |
| BuildVersion              | 10.0.14409.1005         |
| CLRVersion                | 4.0.30319.42000         |
| WSManStackVersion         | 3.0                     |
| PSRemotingProtocolVersion | 2.3                     |
| SerializationVersion      | 1.1.0.1                 |

## 2.4 Modules required for Active Directory Plugins:

**Module name:** ActiveDirectory

Use below command to check available modules via powershell(Open powershell with run as Administrator mode) :

**command:** Get-Module -ListAvailable -Name ActiveDirectory

**Expected output:**

```
Directory: C:\Windows\system32\WindowsPowerShell\v1.0\Modules
```

| ModuleType | Version | Name            | ExportedCommands                                                 |
|------------|---------|-----------------|------------------------------------------------------------------|
| Manifest   | 1.0.0.0 | ActiveDirectory | {Get-ADRootDSE, New-ADObject, Rename-ADObject, Move-ADObject...} |

In normal Windows Desktop OS Active Directory module needs to be installed and setup. In case of Windows Server OS Active Directory module can be setup using Add features in Server Manger.

In the following sections we describe Active Directory module setup on both Windows Desktop OS and Windows Server OS.

## 2.5 Install Active Directory Module on Windows Desktop OS

If Active Directory module is not already installed on Windows Desktop OS following are the steps for Active Directory module installation and setup.

### 2.5.1 Prerequisites

You can use the following versions of Windows:

- Windows 10, Windows 8.1, Windows 8 or Windows 7 Service Pack 1 (SP1)

### 2.5.2 Step 1: Install required software

**Note:** These steps are required once on your computer, not every time you connect.

1. Requires Microsoft .NET Framework 4.5 or above. You can install Microsoft .NET Framework 4.5 or above by following the instructions at [Installing the .NET Framework](#).
2. [Download and install RSAT \(Remote Server Administration Tools\)](#) for supported windows version by referring below locations:

**Note:** Need to restart machine once RSAT is installed

Download locations for RSAT:

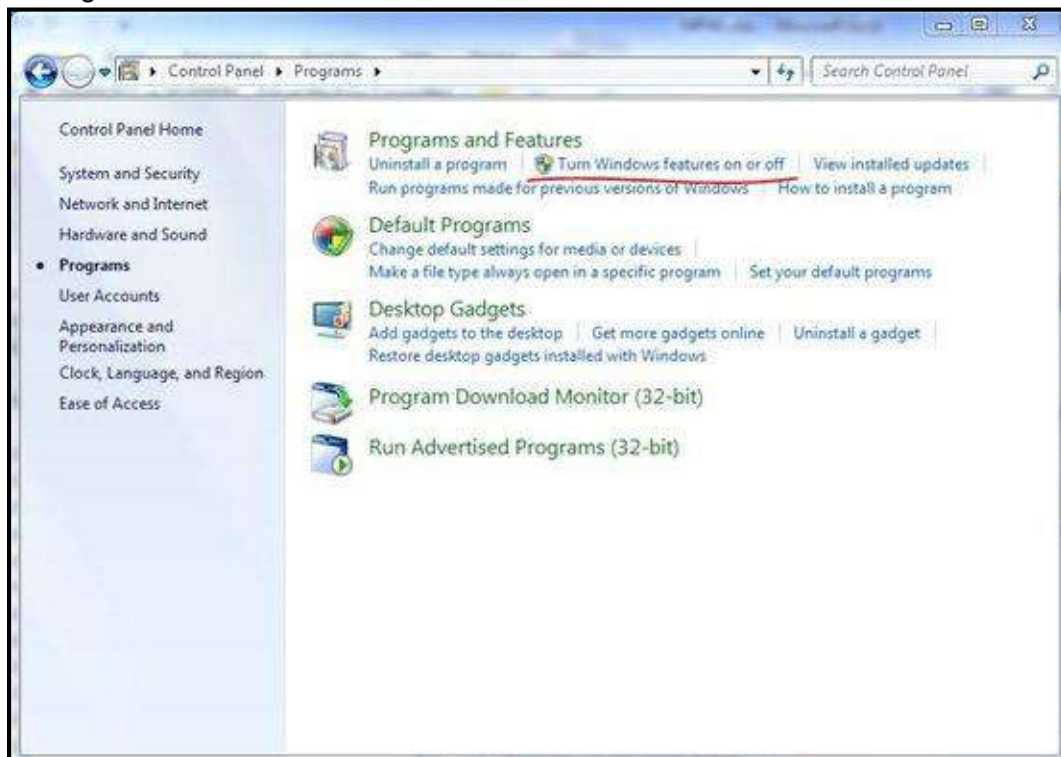

- [Remote Server Administration Tools for Windows 10](#)
- [Remote Server Administration Tools \(RSAT\) for Windows 8.1](#)
- [Remote Server Administration Tools \(RSAT\) for Windows 8](#)

- [Remote Server Administration Tools \(RSAT\) for Windows 7 with SP1 \(both x86 and x64\)](#)
- [Remote Server Administration Tools \(RSAT\) for Windows Vista 32-bit \(x86\)](#)
- [Remote Server Administration Tools \(RSAT\) for Windows Vista 64-bit \(x64\)](#)

### 2.5.3 Step 2: Enable Tools

You must enable the tools that you want to use by using Control Panel. To do this, click **Start**, click **Control Panel**, click **Programs and Features**, and then click **Turn Windows features on or off**.

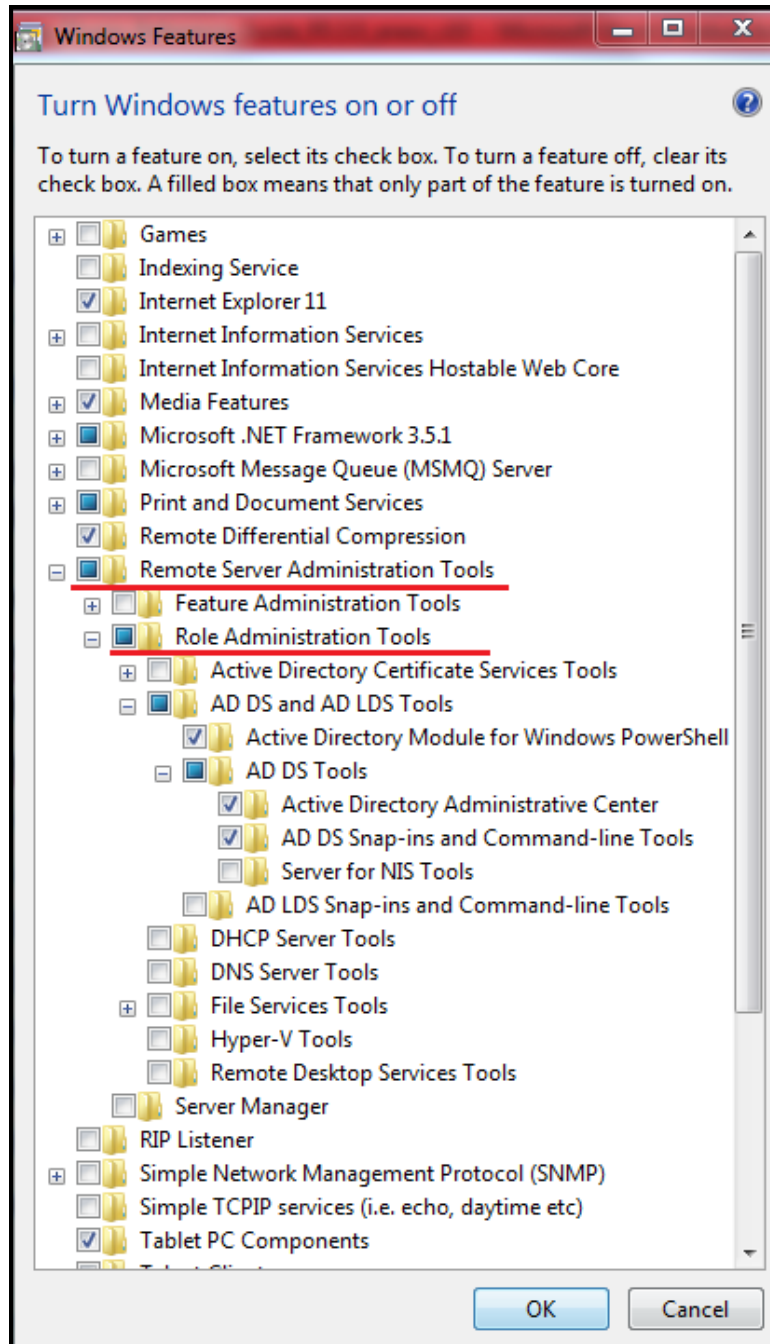

In the RSAT releases for Windows 10, Windows 8.1, and Windows 8, tools are again all enabled by default. You can open **Turn Windows features on or off** to disable tools that you don't want to use. In RSAT for Windows 10, Windows 8.1, and Windows 8, you access GUI-based tools on the **Tools** menu from within the Server Manager console.

For RSAT on Windows Vista and Windows 7, you must enable the tools for the roles and features that you want to manage after you run the downloaded installation package.

**Note:** You don't have to do this for RSAT on Windows 8 or later versions.

To install Active Directory on Windows Vista and Windows 7, click on **Remote Server Administration Tools**, click on **Role Administration Tools**, check the **AD DS and AD LDS Tools** option and click on **OK**.

## 2.6 Install ActiveDirectory Module on Windows Server OS

### 2.6.1 Prerequisites

You can use the following versions of Windows:

- Windows Server 2016, Windows Server 2012 R2, Windows Server 2012, or Windows Server 2008 R2 SP1

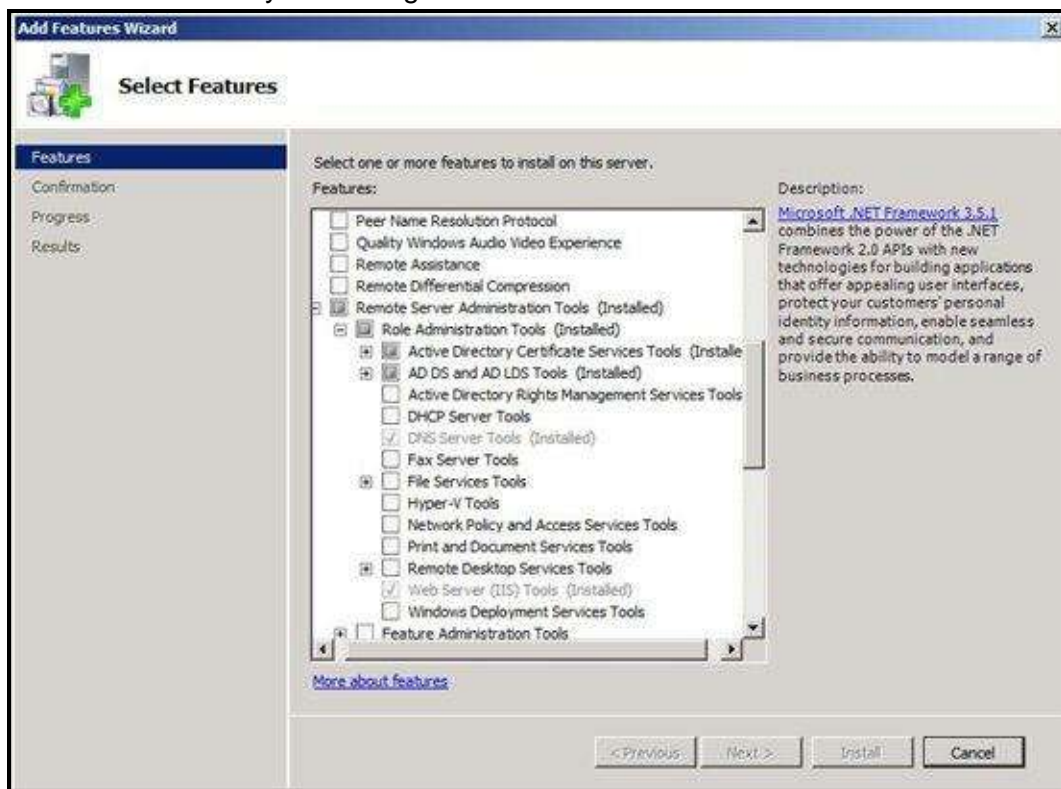

## 2.6.2 Step 1: Install required software

**Note:** These steps are required once on your computer, not every time you connect.

- Requires Microsoft .NET Framework 4.5 or above. You can install Microsoft .NET Framework 4.5 or above by following the instructions at [Installing the .NET Framework](#).

## 2.6.3 Step 2: Enable Tools

If you have to install management tools on Windows Server 2008, Windows Server 2008 R2, Windows Server 2012, or Windows Server 2012 R2 for specific roles or features that are running on remote servers, you don't have to install additional software. Start the Add Features Wizard in Windows Server 2008 or Windows Server 2008 R2 or the Add Roles and Features Wizard in Windows Server 2012 and later versions. Then, on the **Select Features** page, expand **Remote Server Administration Tools**, and then select the tools that you want to install. Complete the wizard to install your management tools.

## 2.6.4 Step 3: Confirm Module Availability

Use below command to check available modules via powershell (Open powershell with run as Administrator mode):

**command:** Get-Module -ListAvailable -Name ActiveDirectory

**Expected output:**

```
Directory: C:\Windows\system32\WindowsPowerShell\v1.0\Modules
```

| ModuleType | Version | Name            | ExportedCommands                                                 |
|------------|---------|-----------------|------------------------------------------------------------------|
| Manifest   | 1.0.0.0 | ActiveDirectory | {Get-ADRootDSE, New-ADObject, Rename-ADObject, Move-ADObject...} |

### 3 Appendix 3: PowerShell Setup - Azure AD

#### 3.1 Pre-requisites for Microsoft Azure use cases:

1. Download Windows Management Framework from below url: (Windows PowerShell version 5.1)

<https://www.microsoft.com/en-us/download/details.aspx?id=54616>

2. **System Requirements:**

- WMF 5.1 requires Microsoft .NET Framework 4.5 or above. You can install Microsoft .NET Framework 4.5 or above by following the instructions at [Installing the .NET Framework](#).
- Use a 64-bit version of Windows. Support for the 32-bit version the Microsoft Azure Active Directory Module for Windows PowerShell was discontinued in October, 2014.
- Need to restart machine once “Windows Management Framework 5.1” installation is completed.

**NOTE:** Open PowerShell by right clicking and select Run as Administrator option and use below commands on that terminal to proceed with module installation.

#### 3.2 Check if PowerShell version is 5.1 using below command:

**Command:** \$PSVersionTable

**Expected output:**

```
Name Value
---- -
PSVersion 5.1.14409.1005
PSEdition Desktop
PSCompatibleVersions {1.0, 2.0, 3.0, 4.0...}
BuildVersion 10.0.14409.1005
CLRVersion 4.0.30319.42000
WSManStackVersion 3.0
PSRemotingProtocolVersion 2.3
SerializationVersion 1.1.0.1
```

### 3.3 Install AzureRM module for Microsoft Azure:

Download **AzureRM** Module using below command: (Choose option as Yes i.e. Y or option A i.e. Yes To All option while installing module when there is any prompt for input)

**Use below command to install module:**

**Command:** Install-Module AzureRM

### 3.4 Import AzureRM Module using below command:

**Command:** Import-Module AzureRM

Check if AzureRM module is installed using below command:

**Command:** Get-Module -ListAvailable -Name AzureRM

**Expected output:**

```
Directory: C:\Program Files\WindowsPowerShell\Modules

ModuleType Version Name ExportedCommands

Script 5.0.1 AzureRM {Add-AzureAnalysisServicesAccount, Add-AzureKeyVaultCertificate, Add-AzureKeyVaultCertificateContact, Add-AzureK...
```

Below sub-modules will be required to run Microsoft Azure use cases: Once **AzureRM** module is installed, it also installs sub-modules. Check if all modules and sub-modules are installed properly using below command:

**Command:** Get-Module -ListAvailable

**Expected output:**

```
Directory: C:\Program Files\WindowsPowerShell\Modules

ModuleType Version Name ExportedCommands

Script 5.1.1 Azure {Get-AzureAutomationCertificate, Get-AzureAutomationConnection, New-AzureAutomationConnection, Remove-AzureAutom...
Script 0.5.0 Azure.AnalysisServices {Add-AzureAnalysisServicesAccount, Restart-AzureAnalysisServicesInstance, Export-AzureAnalysisServicesInstanceLo...
Script 4.0.2 Azure.Storage {Get-AzureStorageTable, New-AzureStorageTableSASToken, New-AzureStorageTableStoredAccessPolicy, New-AzureStorage...
Script 4.0.0 Azure.Storage {Get-AzureStorageTable, New-AzureStorageTableSASToken, New-AzureStorageTableStoredAccessPolicy, New-AzureStorage...

### 3.5 Azure VM plugins parameters:

#### 1. Subscription Id:

- Goto [portal.azure.com](https://portal.azure.com). Login with your credentials. Goto “Subscriptions” tab on the left hand side and copy the “Subscription Id”.

2. Client Id and Authentication Key:
  - Create an Azure Active Directory application.
  - Select Azure Active Directory.

- Select **App registrations**.

- Select **New application registration**.

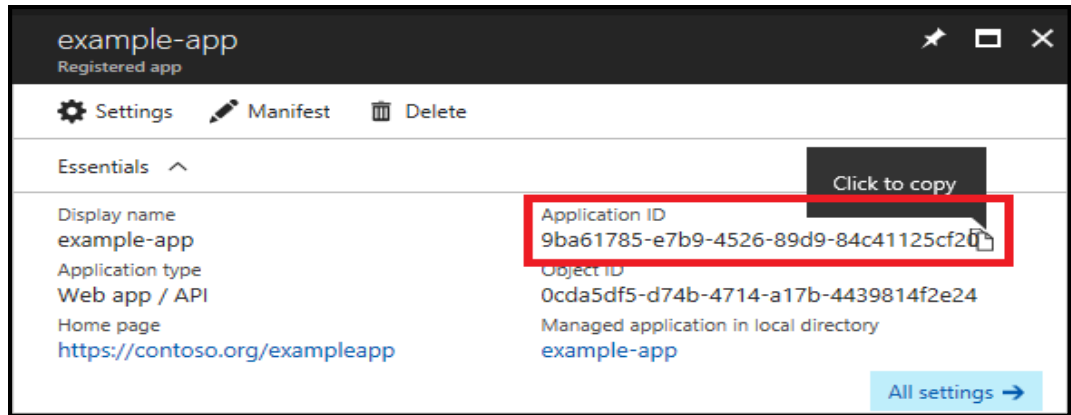

- Provide a name and URL for the application. Select **Web app / API** for the type of application you want to create. You cannot create credentials for a **Native** application; therefore, that type does not work for an automated application. After setting the values, select **Create**.

You have created your application.

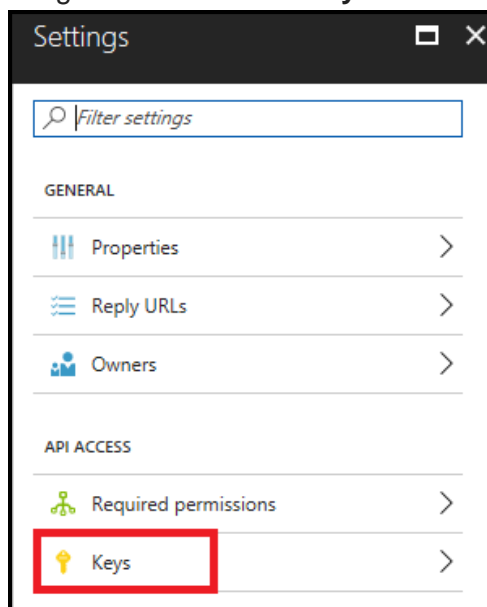

- From **App registrations** in Azure Active Directory, select your application.

| DISPLAY NAME   | APPLICATION TYPE | APPLICATION ID                 |
|----------------|------------------|--------------------------------|
| EX example-app | Web app / API    | 9ba61785-e7b9-4526-89d9-84c... |

- Copy the **Application ID** and store it in your application code. This is your “Client Id”.

- To generate an authentication key, select Settings option as shown in above image and then select **Keys**.

- Provide a description of the key, and duration for the key. When done, select **Save**.

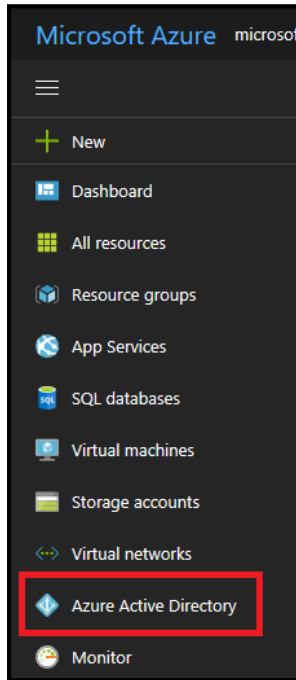

- After saving the key, the value of the key is displayed. Copy this value because you are not able to retrieve the key later. You provide the key value with the application ID to log in as the application. Store the key value where your application can retrieve it.
- Users can generate keys as per their requirements. I.e for 1 year, 2 years and never expiring key.

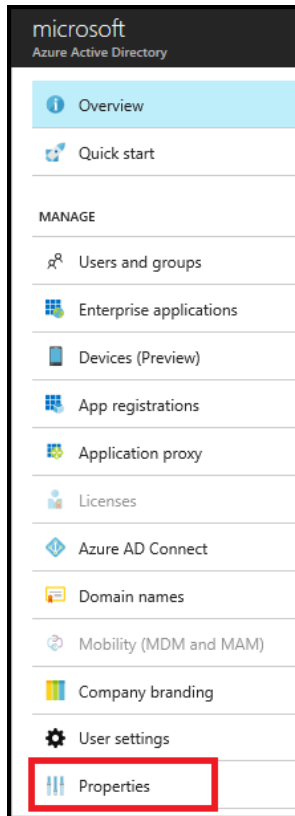

3. Get Tenant Id:

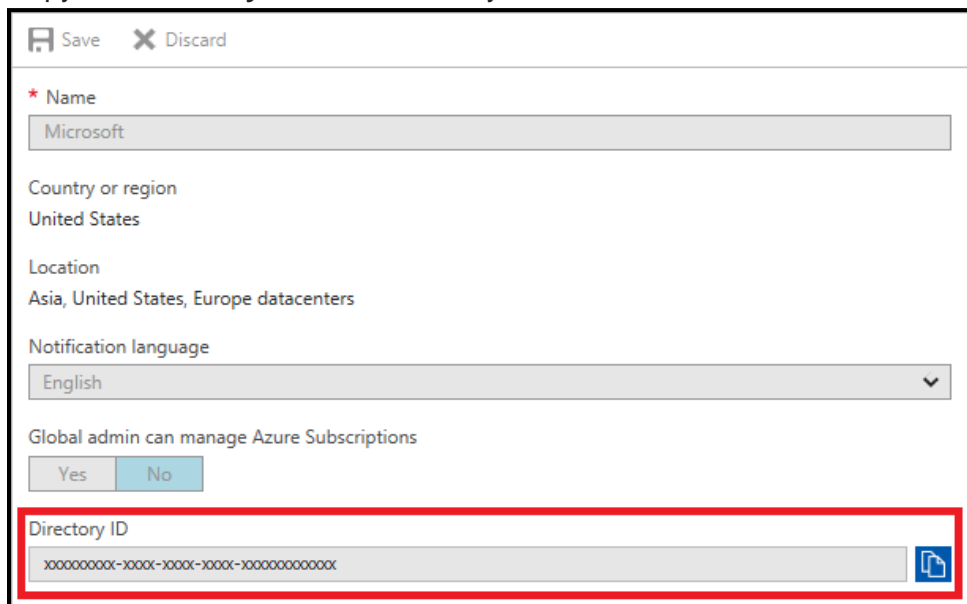

- Select **Azure Active Directory**.

- To get the tenant ID, select **Properties** for your Azure AD tenant.

- Copy the **Directory ID**. This value is your tenant ID.

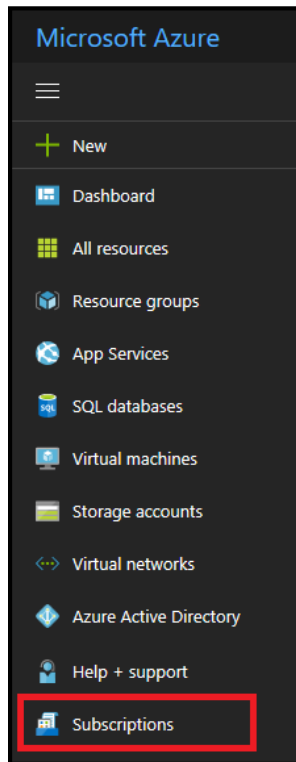

4. Assign application to role:

To access resources in your subscription, you must assign the application to a role. Decide which role represents the right permissions for the application.

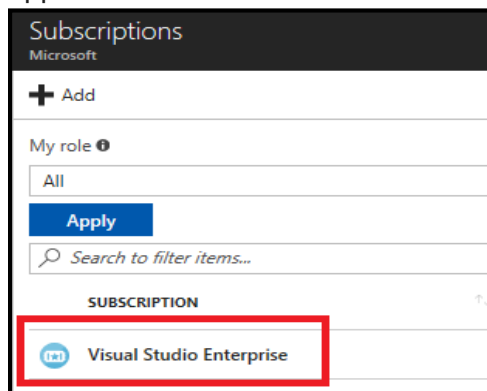

You can set the scope at the level of the subscription, resource group, or resource. Permissions are inherited to lower levels of scope. For example, adding an application to the Reader role for a resource group means it can read the resource group and any resources it contains.

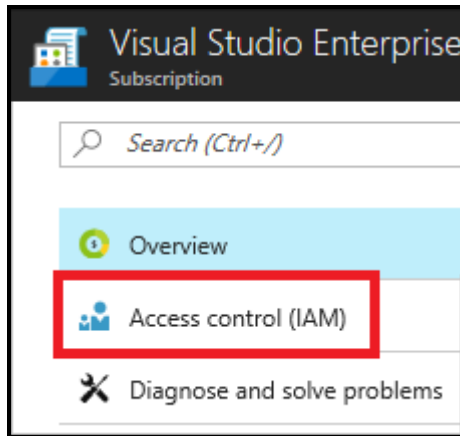

- Navigate to the level of scope you wish to assign the application to. For example, to assign a role at the subscription scope, select **Subscriptions**. You could instead select a resource group or resource.

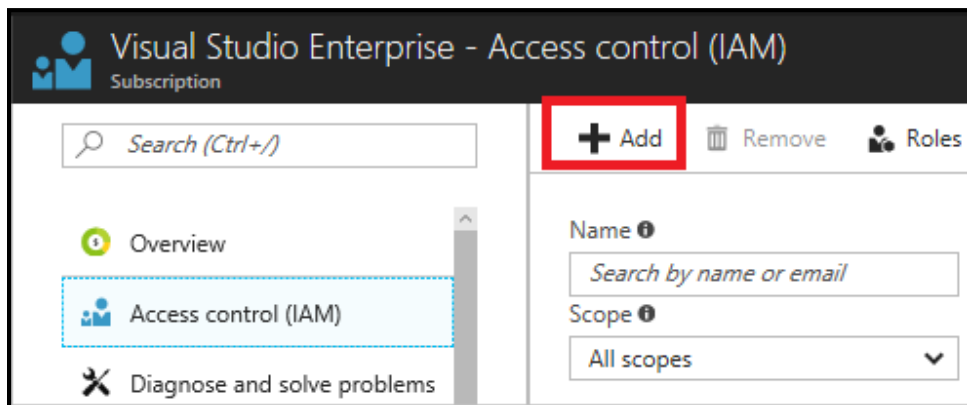

- Select the particular subscription (resource group or resource) to assign the application to.

- Select **Access Control (IAM)**.

- Select Add

- Select the role you wish to assign to the application.

- Search for your application, and select it.
- Select **Save** to finish assigning the role. You see your application in the list of users assigned to a role for that scope.

For More Clarifications you can refer: <https://docs.microsoft.com/en-us/azure/azure-resource-manager/resource-group-create-service-principal-portal>

## 4 Appendix 4: PowerShell Setup - Office 365

### 4.1 Pre-requisites for Microsoft Office365 use cases:

What do you need to know before you begin?

1. Estimated time to complete: 5 minutes
2. You can use the following versions of Windows:  
Windows 10, Windows 8.1, Windows 8 or Windows 7 Service Pack 1 (SP1)  
Windows Server 2016, Windows Server 2012 R2, Windows Server 2012, or  
Windows Server 2008 R2 SP1

**Note:** Use a 64-bit version of Windows. Support for the 32-bit version the Microsoft Azure Active Directory Module for Windows PowerShell was discontinued in October, 2014.

3. The Office 365 work or school account that you use for these procedures needs to be a member of an Office 365 admin role. For more information, see [About Office 365 admin roles](#).

### 4.2 Step 1: Check if required module is installed

**Note:** Open PowerShell from start menu and use below commands for further process.

1. Check if “MSOnline” module is installed by using below command :

**Command:** `Get-Module -ListAvailable -Name MSOnline`

**Expected output:**

```
Directory: C:\Windows\system32\WindowsPowerShell\v1.0\Modules

ModuleType Version Name ExportedCommands

Manifest 1.1.166.0 MSOnline {Get-MsolDevice, Remove-MsolDevice, Enable-MsolDevice, Disable-MsolDevice...}
```

2. Import Module using below command :

**Command:** `Import-Module -Name MSOnline`

### 4.3 Step 2: Install required software

These steps are required once on your computer, not every time you connect.

However, you'll likely need to install newer versions of the software periodically.

Install the 64-bit version of the Microsoft Online Services Sign-in Assistant:  
[Microsoft Online Services Sign-in Assistant for IT Professionals RTW](#).

## 4.4 Office 365 App Registration & Permissions in Azure AD

### 4.4.1 Register App

1. Sign in to your Azure Account through the [Azure portal](#).
2. Select the **Azure Active Directory**.
3. Select **App registrations**.
4. Select an App created for AutomationEdge Plugin steps or alternatively, Select **New registration**.
5. Name the application. Select a supported account type, which determines who can use the application.
6. Additionally, for email related steps- Download Email Attachments, Email Message Input and Send Email, under **Redirect URI**, select **Web** for the type of application you want to create. For example, <https://automationedge.com> as seen in the screenshot below. Select **Register**.

\* Name  
The user-facing display name for this application (this can be changed later).  
example-app ✓

Supported account types  
Who can use this application or access this API?  
 Accounts in this organizational directory only (Microsoft only - Single tenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant) and personal Microsoft accounts (e.g. Skype, Xbox)  
[Help me choose..](#)

Redirect URI (optional)  
We'll return the authentication response to this URI after successfully authenticating the user. Providing this now is optional and it can be changed later, but a value is required for most authentication scenarios.  
 Web ✓ <https://graph.microsoft.com> ✓

By proceeding, you agree to the Microsoft Platform Policies [☑](#)

**Register**

7. Upon registration fetch Tenant ID and Client ID for the App as seen below.

Dashboard > VYOM LABS PVT. LTD. > example-app

 Code samples  
 Microsoft Graph

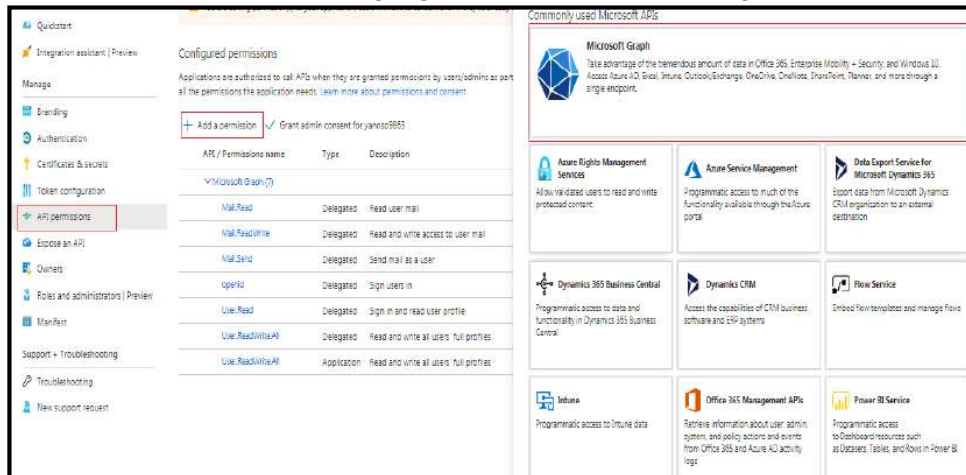

#### 4.4.2 Creating Client Secret

1. Click on Certificates and secrets
2. Click on New client secret
3. Enter Description
4. Select one of Expires Radio Button

#### 4.4.3 Provide API Permission

1. Click on API Permission.
2. Click on Add Permission.
3. Click 'Microsoft Graph' as highlighted below on the top right corner.

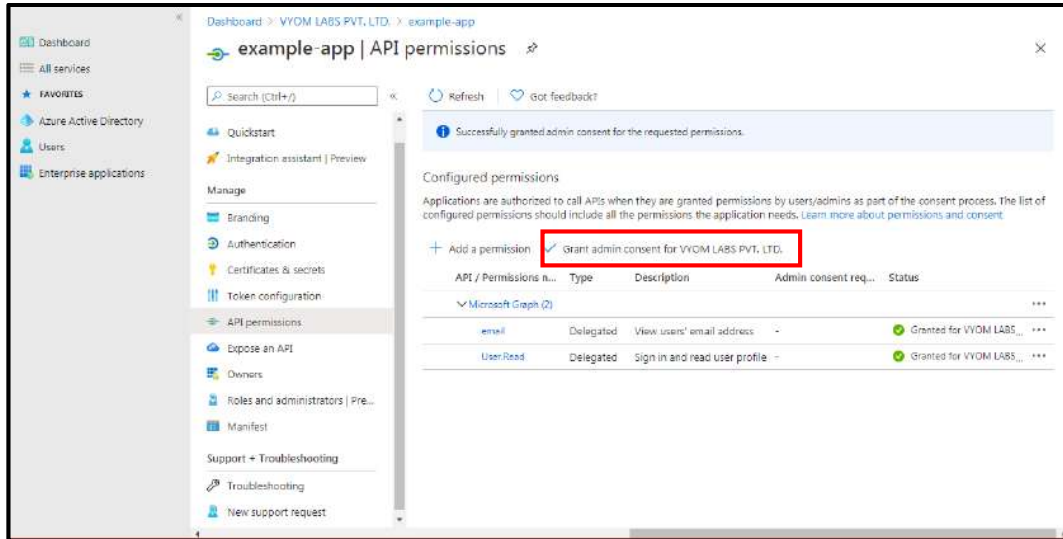

4. Click 'Delegated Permissions' or 'Application permissions' as required and as mentioned in the Plugin Step documentation.
5. Provide all required permissions for the Plugin steps to execute. The permissions required are mentioned in the Plugin steps.

### 4.5 Consent for Permission to App

### 4.5.1 Grant admin consent

You need to Grant Admin consent to the app to access all accounts data, for all Plugin steps except email related steps.

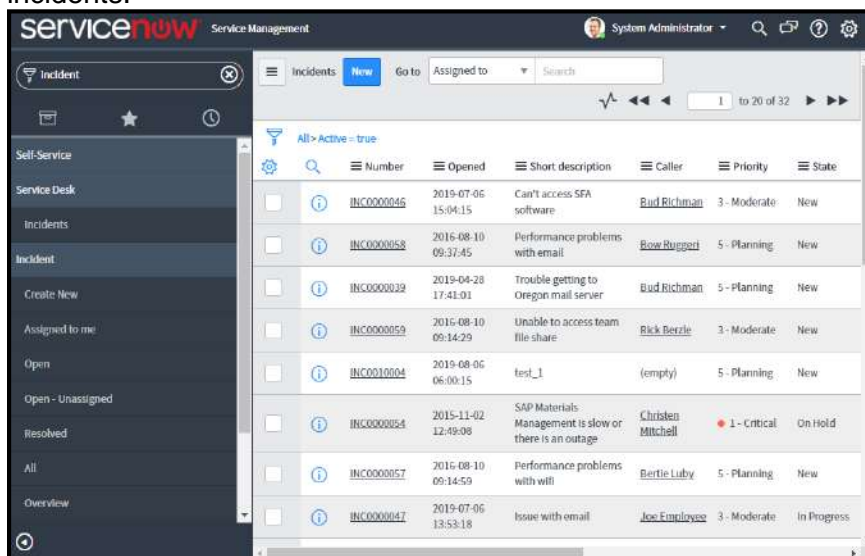

Users can request Azure AD administrator to grant admin consent. The following screenshot shows an Administrator view with option to Grant Admin consent.

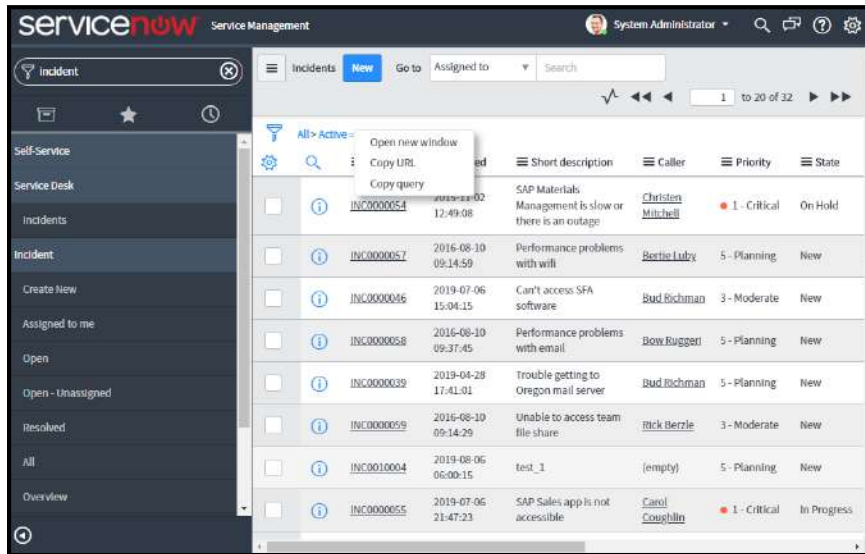

## 5 Appendix 5: Build Criteria Query in SNOW UI

You can build Criteria Query or alternatively create filters in SNOW UI and copy Criteria Query from the UI. This is especially useful for complex query criteria with one or more AND, OR criteria.

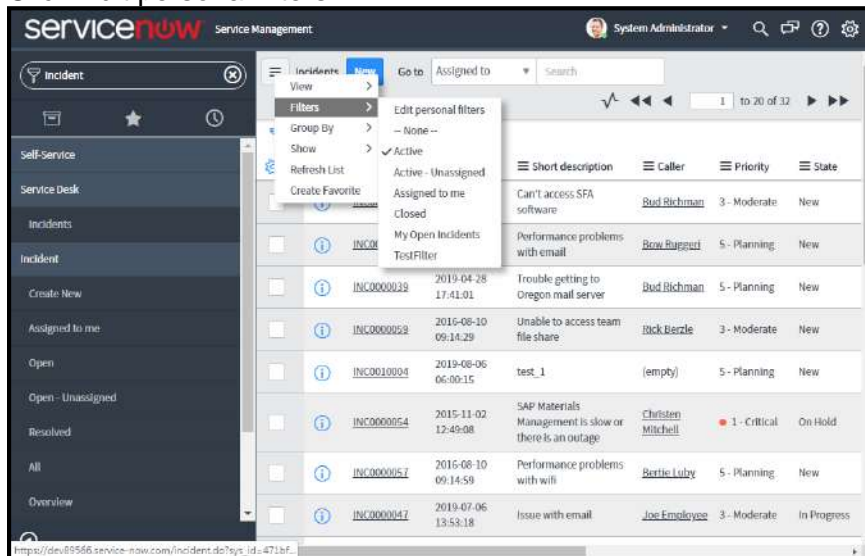

- The following is a screen shot of the Incident Application. You can see the filter sign on top of the column headings. It shows the filter Active=True has been applied on All incidents.

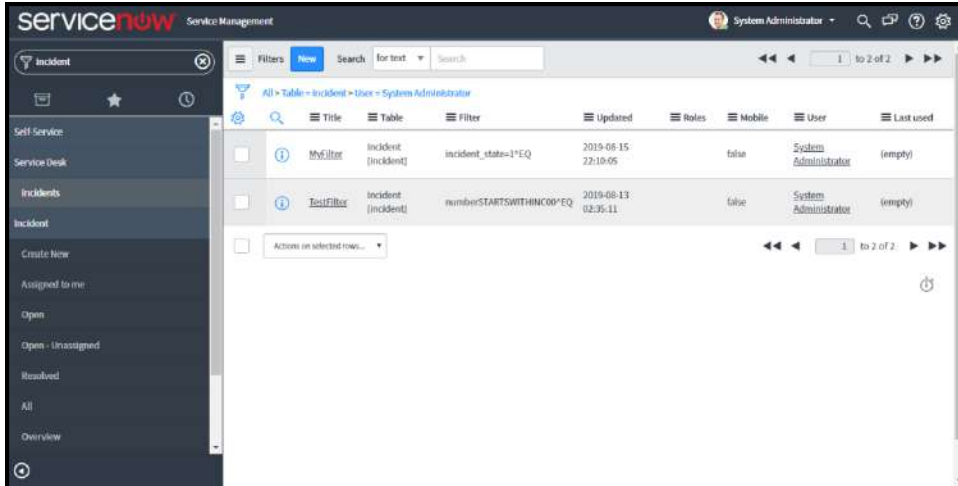

- You may right click on the filter and click Copy query to copy the Criteria Query.

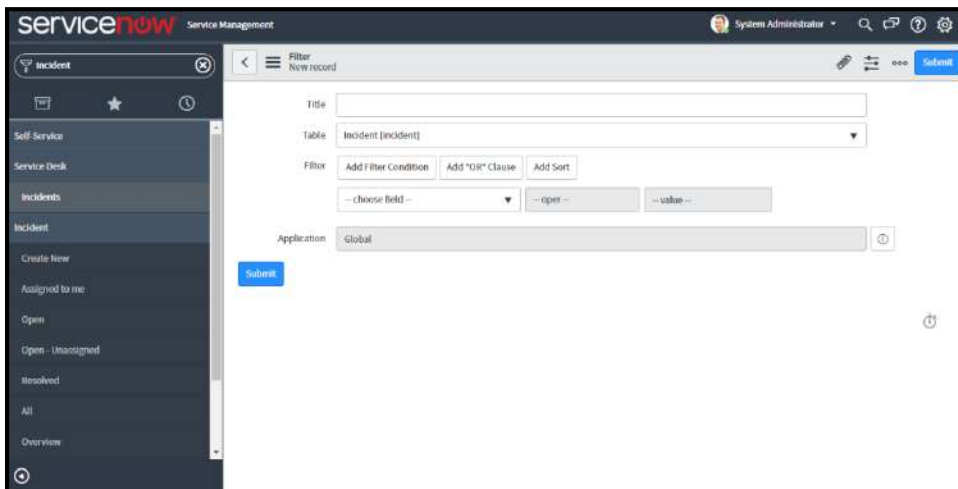

- You may paste this as Criteria Query in the plugin step.
  - active=true
- You may right click on to see the Filters menu. In Filter menu the first option is to Edit personal filters. The rest are the out of the box or user created filters. You may click Edit existing filters or create new filters.
- Click Edit personal filters.

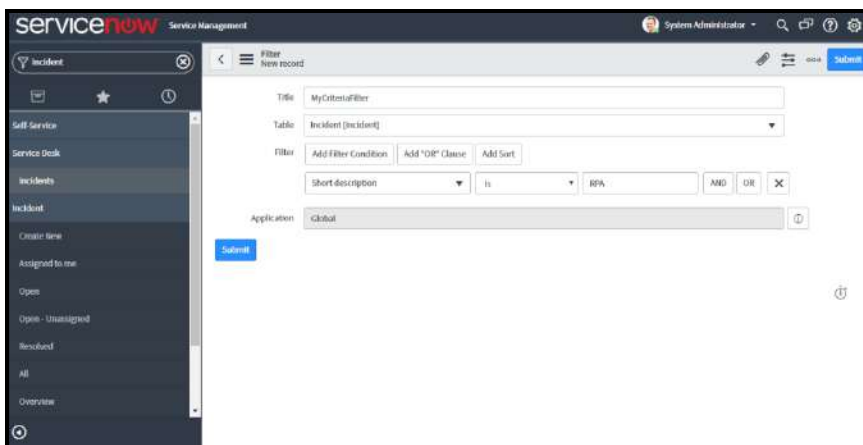

- Once you click Edit personal filters you can see your filters. Click New to create a new filter.

7. The following screen appears.

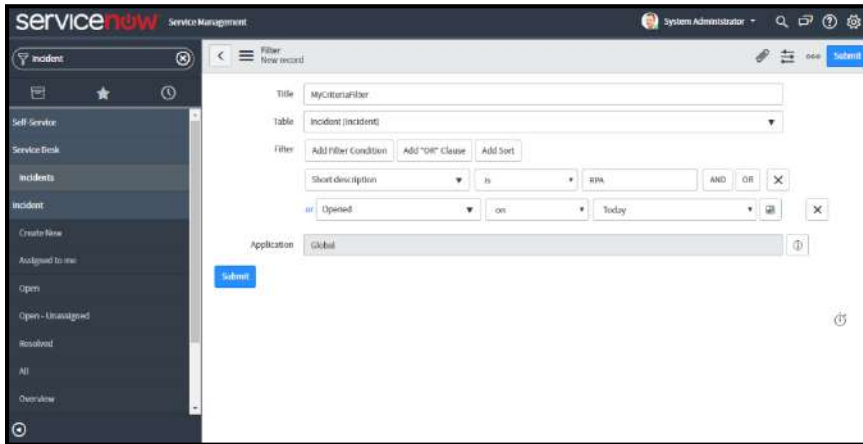

8. Provide a Title. In Choose field, Select Short description, in oper select is and in value type RPA. Click OR.

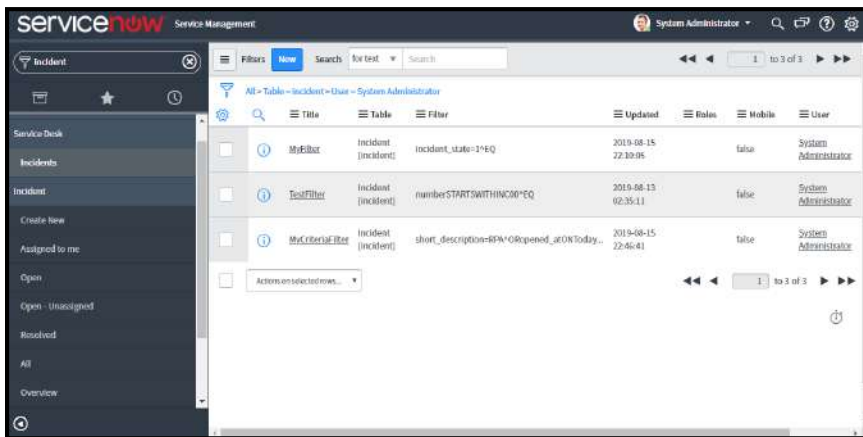

9. In the second OR condition select Opened on Today. Click Submit.

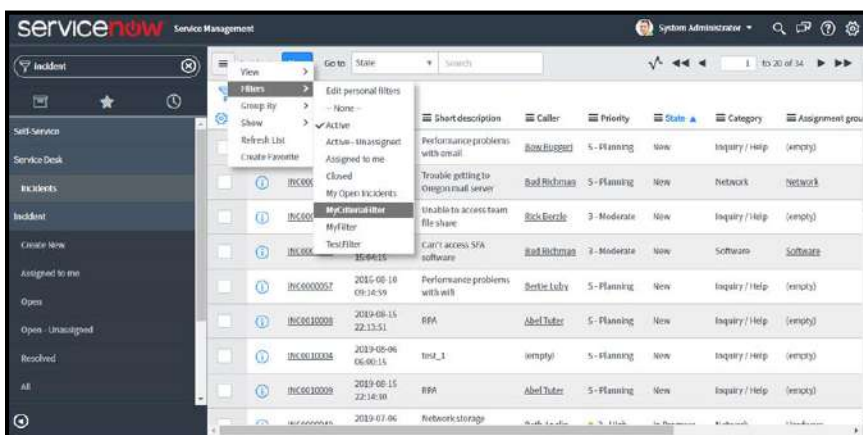

10. MyCriteriaFilter is now visible in the filter list.

11. Click Incident menu on the left navigation to see All incident records.

12. Click ≡. Select Filter menu and then select MyCriteriaFilter.

- You can now see the filtered list with MyCriteriaFilter applied. You can see the filter applied: Short\_description=RPA or Opened Today.

- Right click on the filter and click Copy query.

- The Criteria query is as follows:  
[short\\_description=RPA^ORopened\\_atONToday@javascript:gs.beginningOfToday\(\)@javascript:gs.endOfToday\(\).](https://short_description=RPA^ORopened_atONToday@javascript:gs.beginningOfToday()@javascript:gs.endOfToday().)
- You may now use it in the Plugin step.

## 6 Appendix 6: Power Shell Remote Connection

### 6.1 Description

Perform the steps below to invoke PowerShell Script on Remote Machine (Enable WinRM Protocol and set trusted host list value to \* on local as well as target system)

### 6.2 Parameters

Input Tab:

| No. | Field Name | Description |
|-----|------------|-------------|
|-----|------------|-------------|

© 2023 AutomationEdge Inc All Rights Reserved.  
 This document is for your company's internal use only and may not be distributed to any third party.

|   |               |                                          |
|---|---------------|------------------------------------------|
| 1 | Computer Name | IP Address of remote Machine.            |
| 2 | Credentials   | Username and Password of Remote Machine. |

## 6.3 Prerequisites

### 6.3.1 Set Up Your Workgroup

For PowerShell Remoting to work in a workgroup environment, you must configure your network as a private or domain, not public network.

For guidance on this refer to below link  
[Guide on private and public networks.](#)

Following exception occurs if the network is public.

Set-WSManQuickConfig: WinRM firewall exception will not work since one of the network connection types on this machine is set to Public. Change the network connection type to either Domain or Private and try again.

### 6.3.2 Enable PowerShell Remoting on the PC You Want to Access Remotely

Your first step is to enable PowerShell Remoting on the PC to which you want to make remote connections. On that PC, you'll need to open PowerShell with administrative privileges.

Command- **Enable-PSRemoting -Force**

Following error occurs if this command is not executed

[<IP Address>] Connecting to remote server <IP Address>failed with the following error message: Access is denied. For more information, see the about\_Remote\_Troubleshooting Help topic. + CategoryInfo : OpenError: (10.41.16.51:String) [], PSRemotingTransportException+ FullyQualifiedErrorId : AccessDenied,PSSessionStateBroken

### 6.3.3 Configure the Trusted Hosts setting.

You need to configure the TrustedHosts setting on PC you want to connect from, so the computers will trust each other.

If you want to go ahead and trust PC to connect remotely, you can type the following cmdlet in PowerShell (again, you'll need to run it as Administrator).

**Set-Item WSMan:\localhost\Client\TrustedHosts -Value \$IPAddress -Force**

To add more than one machine to the trusted hosts list using winrm  
**winrm set winrm/config/client '@{TrustedHosts=" IPAddress1, IPAddress2,... "'}**

Following error occurs if this command is not executed

Connecting to remote server <IP Address>failed with the following error message: The WinRM client cannot process the request. If the authentication scheme is

different from Kerberos, or if the client computer is not joined to a domain, then HTTPS transport must be used or the destination machine must be added to the TrustedHosts configuration setting. Use winrm.cmd to configure

TrustedHosts. **Note:** that computers in the TrustedHosts list might not be authenticated. You can get more information about that by running the following command: `winrm help config`. For more information, see the [about\\_Remote\\_Troubleshooting Help](#) topic.

+ CategoryInfo: OpenError: (10.41.11.5:String) [], PSRemotingTransportException

+ FullyQualifiedErrorId : ServerNotTrusted,PSSessionStateBroken

### 6.3.4 Test Connection

On the PC you want to access the remote system from, type the following cmdlet into PowerShell (replacing “COMPUTER” with the name or IP address of the remote PC),

#### Test-WsMan COMPUTER

This simple command tests whether the WinRM service is running on the remote PC. If it completes successfully, you’ll see information about the remote computer’s WinRM service in the window—signifying that WinRM is enabled and your PC can communicate. If the command fails, you’ll see an error message instead.

### 6.3.5 Set-ExecutionPolicy

Change the user preference for the execution policy of the shell.

Syntax:

```
Set-ExecutionPolicy [-executionPolicy] Policy
{Unrestricted | RemoteSigned | AllSigned | Restricted | Default | Bypass | Undefined}
[[-Scope] ExecutionPolicyScope] [-Force]
```

Example:

```
Set-ExecutionPolicy -Scope CurrentUser -ExecutionPolicy Unrestricted
```

Valid values:

1. Restricted  
Do not load configuration files or run scripts.  
This is the default.
2. AllSigned  
Require that all scripts and configuration files be signed by a trusted publisher, including scripts that you write on the local computer.
3. RemoteSigned  
Require that all scripts and configuration files downloaded from the Internet be signed by a trusted publisher.
4. Unrestricted  
Load all configuration files and run all scripts.  
If you run an unsigned script that was downloaded from the internet, you are prompted for permission before it runs.
5. Bypass

Nothing is blocked and there are no warnings or prompts.

#### 6. Undefined

Remove the currently assigned execution policy from the current scope. This parameter will not remove an execution policy that is set in a Group Policy scope.

The following is a description of the flags

1. -Force:  
Suppress all prompts.  
By default, Set-ExecutionPolicy displays a warning whenever the execution policy is changed.
2. -Scope ExecutionPolicyScope  
This flag sets the scope of the execution policy.

Valid values are:

- Process: Affects only the current PowerShell process.
- CurrentUser: Affects only the current user.
- LocalMachine: Affects all users of the computer.
- To remove an execution policy from a particular scope, set the execution policy for that scope to Undefined.

### 6.3.6 Execute a single Remote command

To run a command on the remote system, use the Invoke-Command cmdlet using the following syntax:

```
Invoke-Command -ComputerName COMPUTER -ScriptBlock {COMMAND} -credential
```

“COMPUTER” represents the remote PC’s name or IP address. “COMMAND” is the command you want to run.

Using Invoke-Command -ScriptBlock on a local function with arguments:

```
Invoke-Command -Credential $c -ComputerName COMPUTER -ScriptBlock ${function: Functionname} -ArgumentList $x, $y,
```

### 6.3.7 Parse output of Remote Command

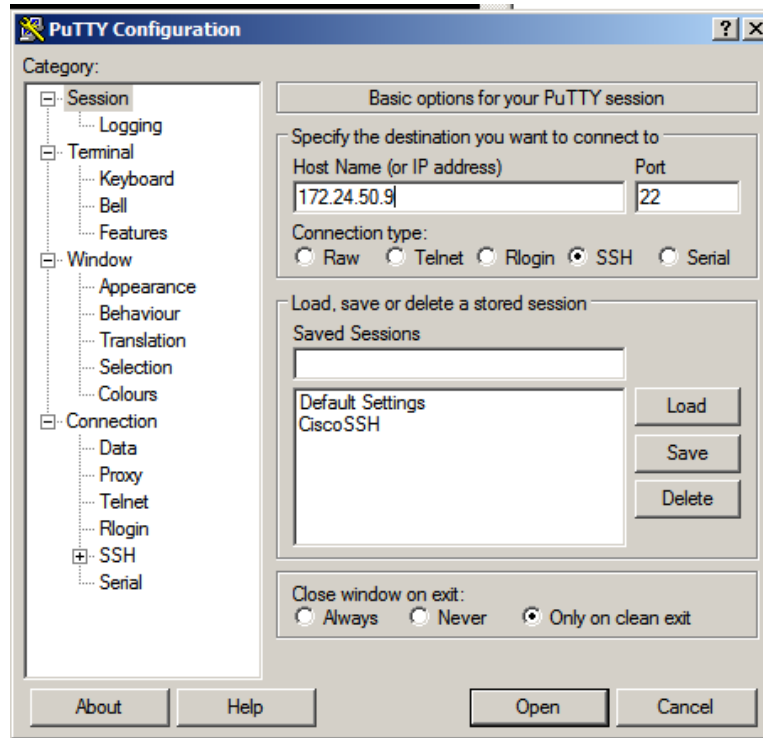

```
$variablename=Invoke-Command -ComputerName COMPUTER -ScriptBlock {COMMAND} -credential
foreach ($xyz in $variablename)
{
$xyz
}
```

## 7 Appendix 7: Cisco

### 7.1 Connecting to Cisco with SSH

1. Use Putty to connect to CISCO Switch.
2. Provide the given IP Address and Port and click on Open

3. After clicking on Open, it will prompt for Security Alert, click on “Yes”.
4. The console will ask you to enter the username and password by which you have to login to the Switch. Enter the provided username and password.

5. It will prompt for “VyomSwitch#”, you can start writing your commands after #.

## 7.2 Commands used for Plugins.

### 1. Backup Configuration:

- To take backup you require to have TFTP Server. Download and install Tftp Server.

- Connect to putty as mentioned above and use the below command to take backup of the switch:
  - **VyomSwitch#copy running-config tftp**
  - Address or name of remote host []? **10.51.29.28**
  - Destination filename [vyomswitch-config]? **backupFile!!**
  - 8859 bytes copied in 2.156 secs (4109 bytes/sec)
2. **Get Interface from IP Address**
    - To get interface from IP Address execute the following command:
    - **show ip arp | include Hardware Addr | 172.24.50.9**
  3. **Get Interface from Mac Address**
    - To get interface from MAC Address execute the following command:
    - **show mac address-table | include Type | 0011.9390.f600**
  4. **Get Interface Status**
    - To get interface from MAC Address execute the following command:
    - **show interface fa0/1 status**
  5. **Shutdown Interface**
    - To shutdown the interface use the below set of command:
    - **VyomSwitch# config terminal**
    - Enter configuration commands, one per line. End with CNTL/Z.
    - **VyomSwitch(config)# interface f0/1**
    - **VyomSwitch(config-if)# shutdown**
    - **VyomSwitch(config-if)# end**
  6. **No Shutdown Interface**
    - To start the interface use the below set of command:
    - **VyomSwitch#config terminal**
    - Enter configuration commands, one per line. End with CNTL/Z.
    - **VyomSwitch(config)#interface f0/1**
    - **VyomSwitch(config-if)#no shutdown**
    - **VyomSwitch(config-if)#end**

## 7.3 Additional Commands used for Plugins.

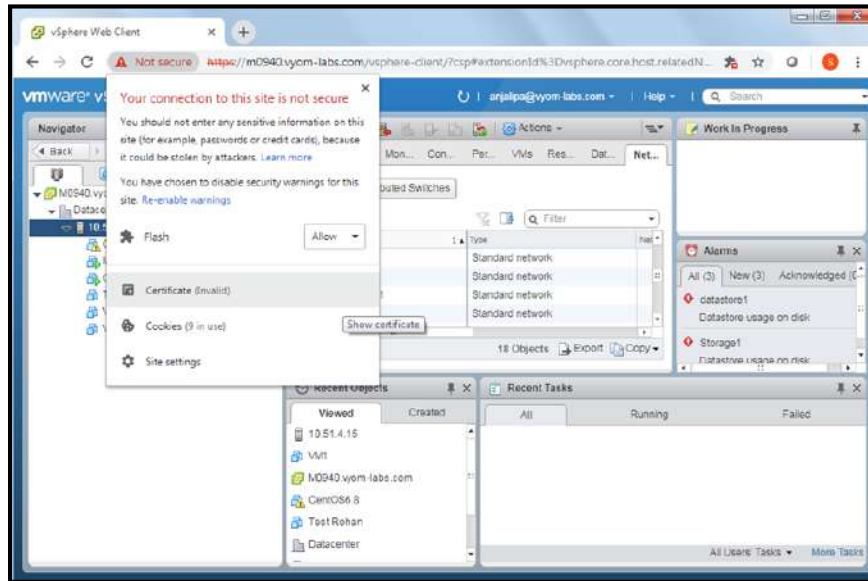

1. **To get host name**
  - **show configuration | inc hostname**
2. **set terminal**
  - **terminal length 0**

## 8 Appendix 8: Install VMware certificate

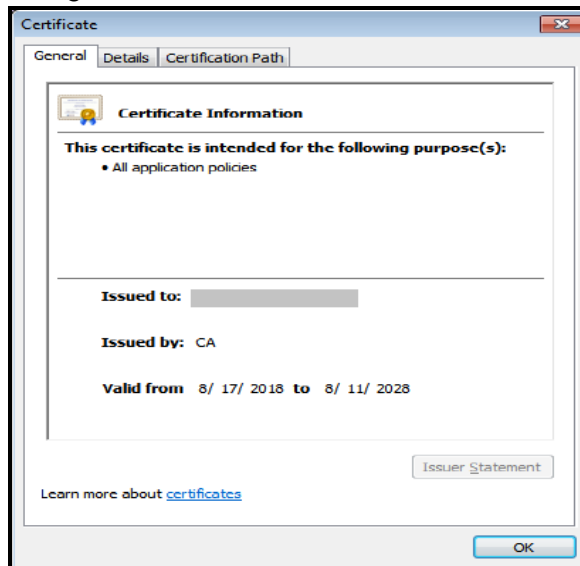

We need to instal VMware certificate to jvm

### 8.1 Export Certificate

1. Log in to vCenter Server using specified server name (https://vmware.example.com) and follow the below procedure to install the certificate.

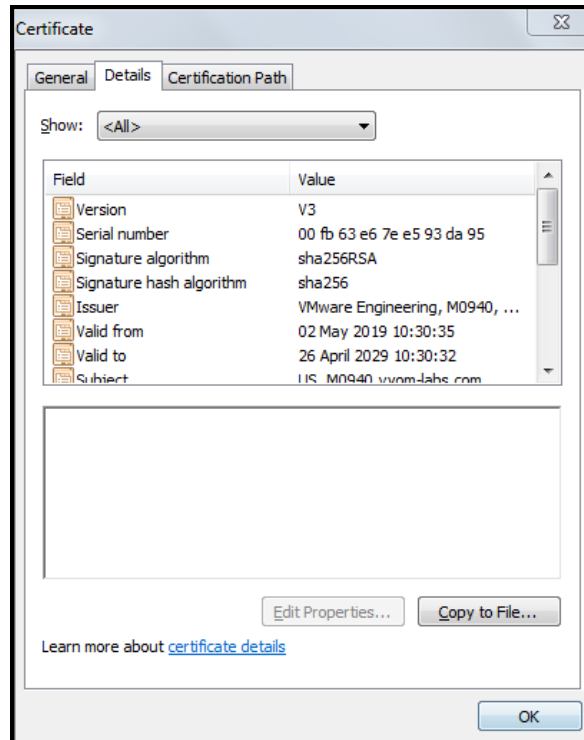

2. The Certificate Windows opens.
3. Navigate to the Details tab.

4. Click Copy to File button while on Details tab.

5. The Certificate Export Wizard appears.
6. Click Next

7. Select the format as shown below.
8. Click Next.

9. Browse a file path to download the certificate.

10. Provide a name for the certificate.

11. Click Save.

12. You can now see the file path in the Certificate Export Wizard.

13. Click Next

14. This is the final step: Completing the Certificate Export.

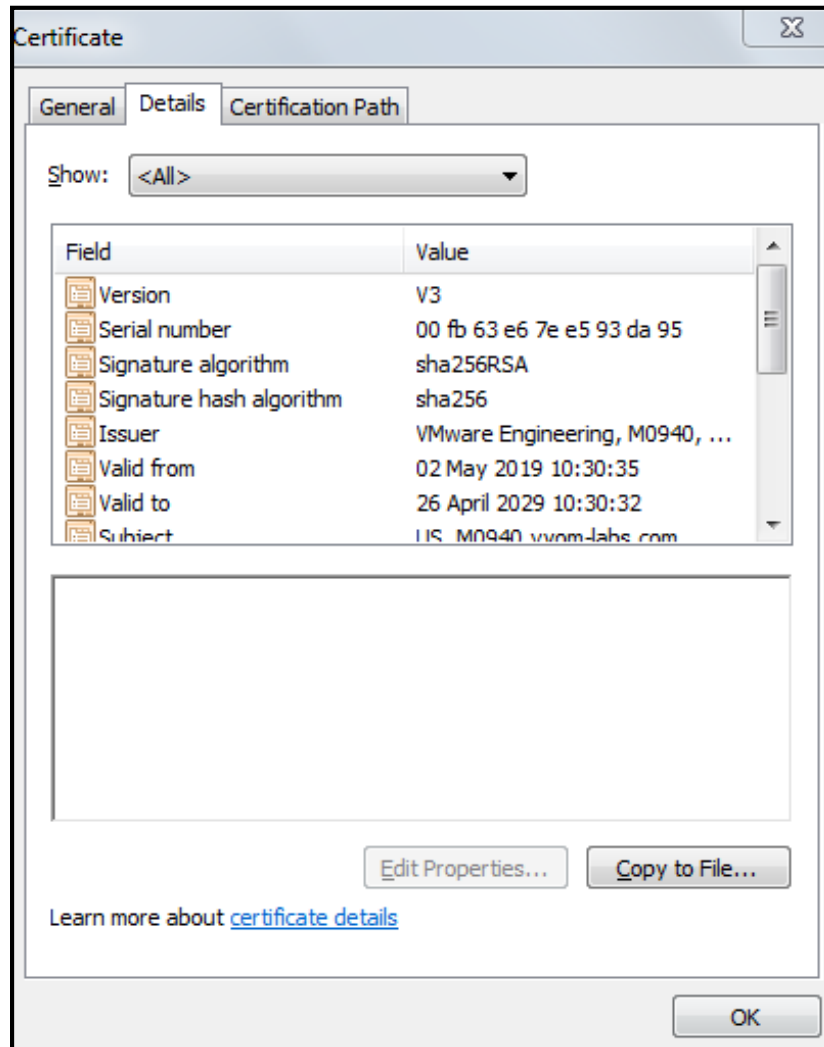

15. Click Finish.

- 16. A pop-up window appears showing the export was successful.
- 17. Click OK.

18. Click OK.

19. This completes the process of exporting the Certificate.

## 8.2 Import Certificate to Java Keystore

Once the certificate is exported (downloaded on the system), execute the below two commands to import the vCentre Server certificate.

1. Open command prompt in Run As Administrator mode and run below commands:
2. Change directory to the following path:

```
C:\Windows\system32>cd <JAVA_HOME>\jre\lib\security
```

3. Now run the below command:

```
C:\Program Files\Java\jdk1.8.0_92\jre\lib\security>
keytool -import -keystore cacerts -file "<file path>\example.cer" -alias vmware
```

```
Enter keystore password:
```

```
Trust this certificate? [no]: y
```

```
Certificate was added to keystore
```

**Note:**

- Enter password “changeit”, when prompt is displayed is Enter keystore password:
  - (It is default password for cacerts file where domain entry is done for VMware certificate)
- Type option “y” or “yes” when prompt is displayed like Trust this certificate? [no]:
- Give full path of saved certificate (example.crt) file in front of -file parameter in the command.

4. Change directory to the following path:

```
C:\Windows\system32>cd <JAVA_HOME>\jre\lib\security
```

Perform Step 3 process again.

## 9 Appendix 9: Enrolling devices for MDM in AirWatch

You can enroll Android, Apple, QNX, Chrome OS and Windows OS devices in AirWatch.

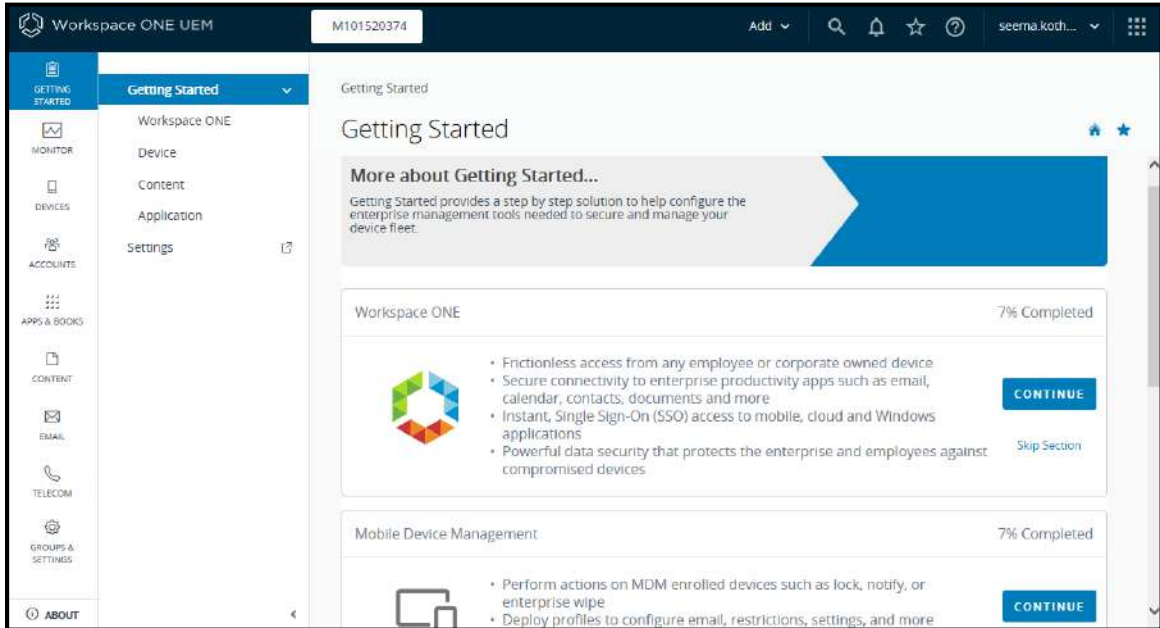

Following are the steps to Setup Mobile Devices,

## 9.1 Setup Apple MDM

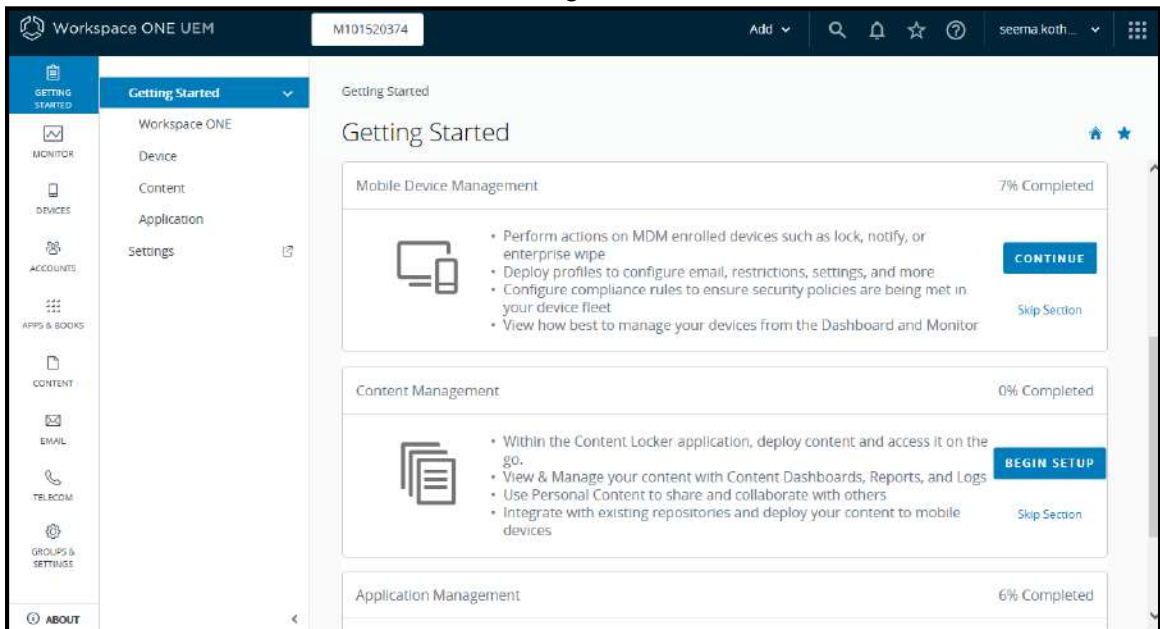

This section is specific for MDM (Mobile Device Management) setup for Apple Devices.

Following are the steps to setup Apple MDM,

1. Navigate to the Getting Started menu.

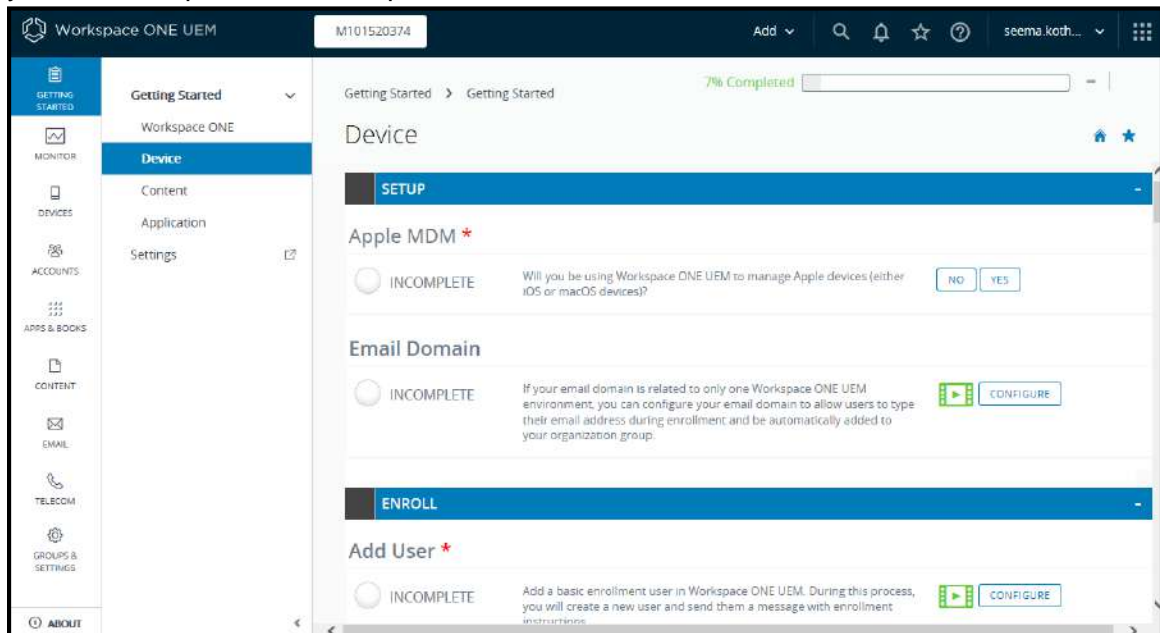

2. Click Continue next to Mobile Device Management.

3. If you wish to enroll an Apple Device complete Apple MDM and Apple Certificate Setup as shown against  icon below.

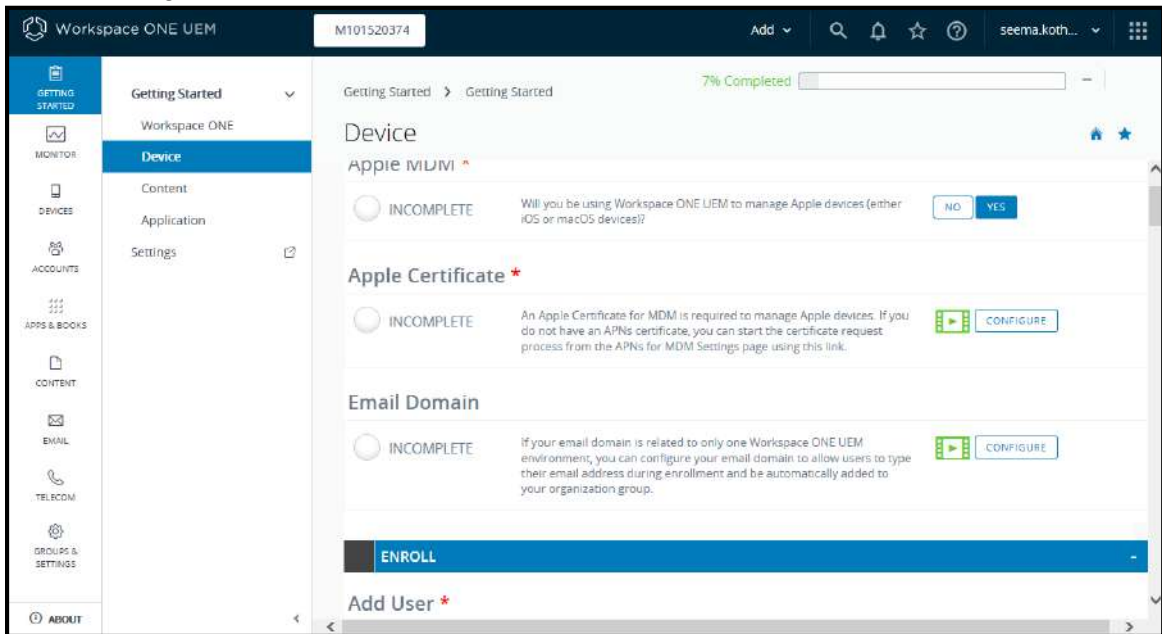

Apple device Setup is wizard based, where you need to perform the following steps,

- i. Make sure you have Safari, Firefox or Chrome browser. Internet Explorer is not supported.
  - ii. The first step of the wizard is - Download certificate signing request from AirWatch Administrator console (MDM\_APNsRequest.plist).
  - iii. Login to Apple Certificate Portal using your Apple ID, select “Generate Certificate” and upload the previously downloaded file to the Apple Push Certificate Portal.
  - iv. Download the APNs certificate file (\*.pem) provided by Apple and upload it here.
4. You can see that Apple MDM step is incomplete. If you will be using Workspace ONE UEM(AirWatch) to manage Apple devices click Yes button. For devices other than Apple you need not perform this step.

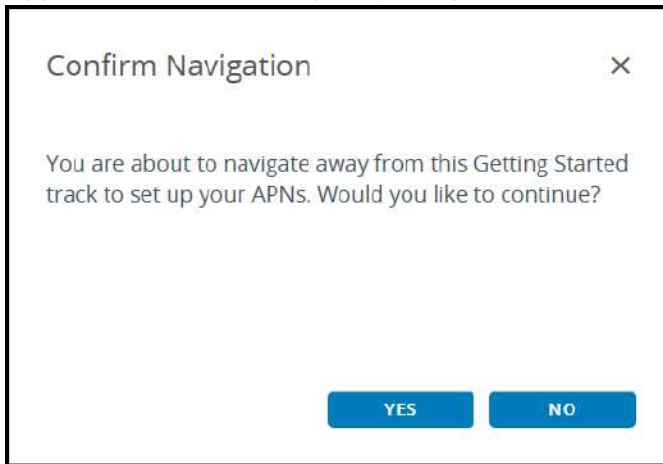

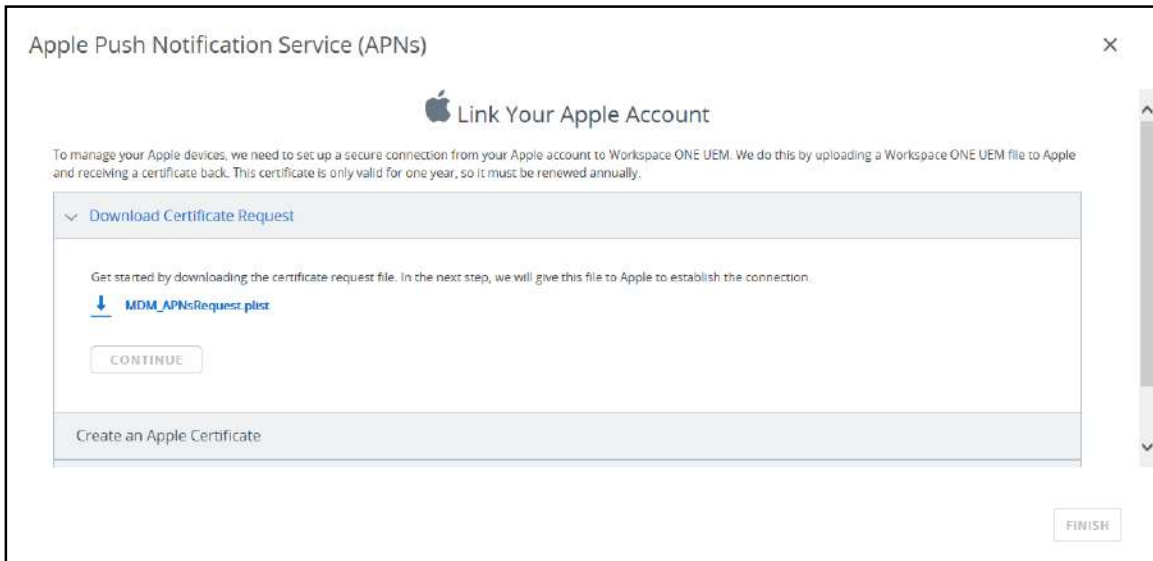

5. The following screen shot shows that Yes has been selected.

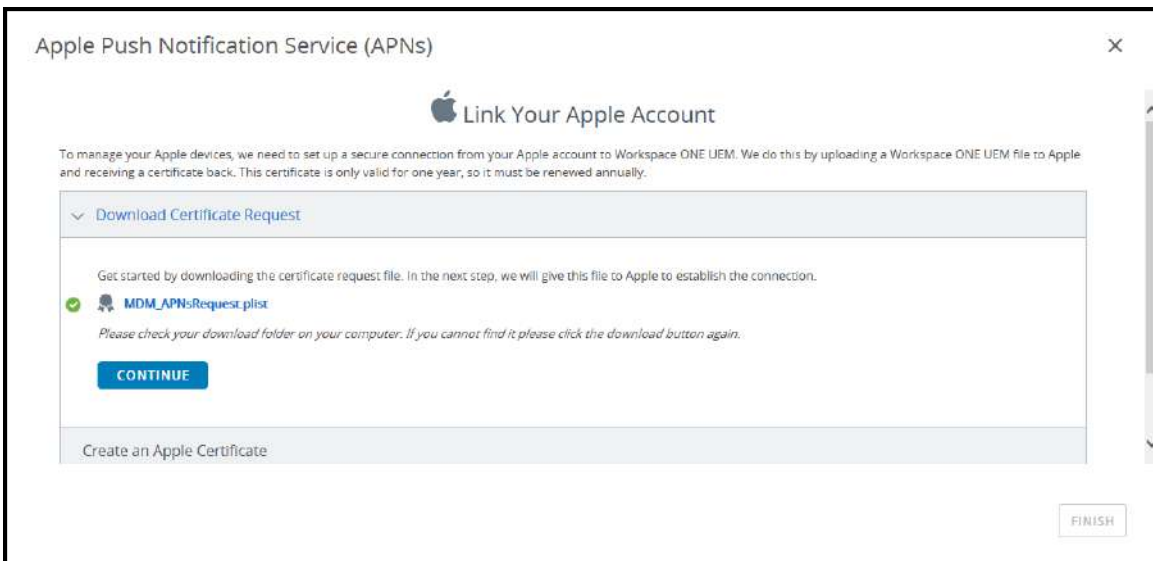

6. Once you click Yes above you get a popup as shown below. Click Yes to navigate to Apple Push Notification(APN) setup.

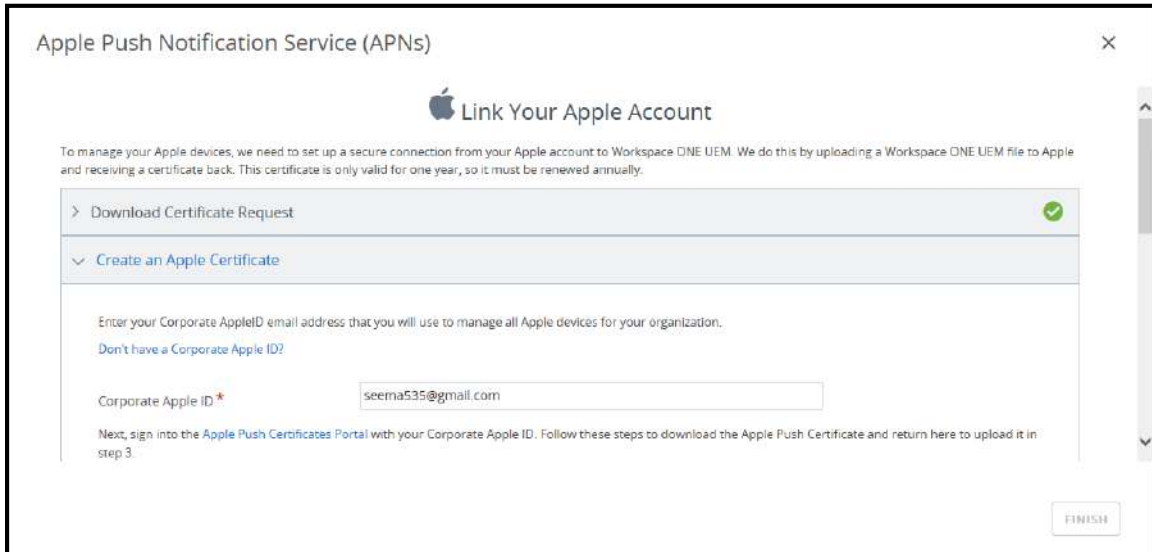

7. Click on the link to download Certificate Request (MDM\_APNsRequest.plist)

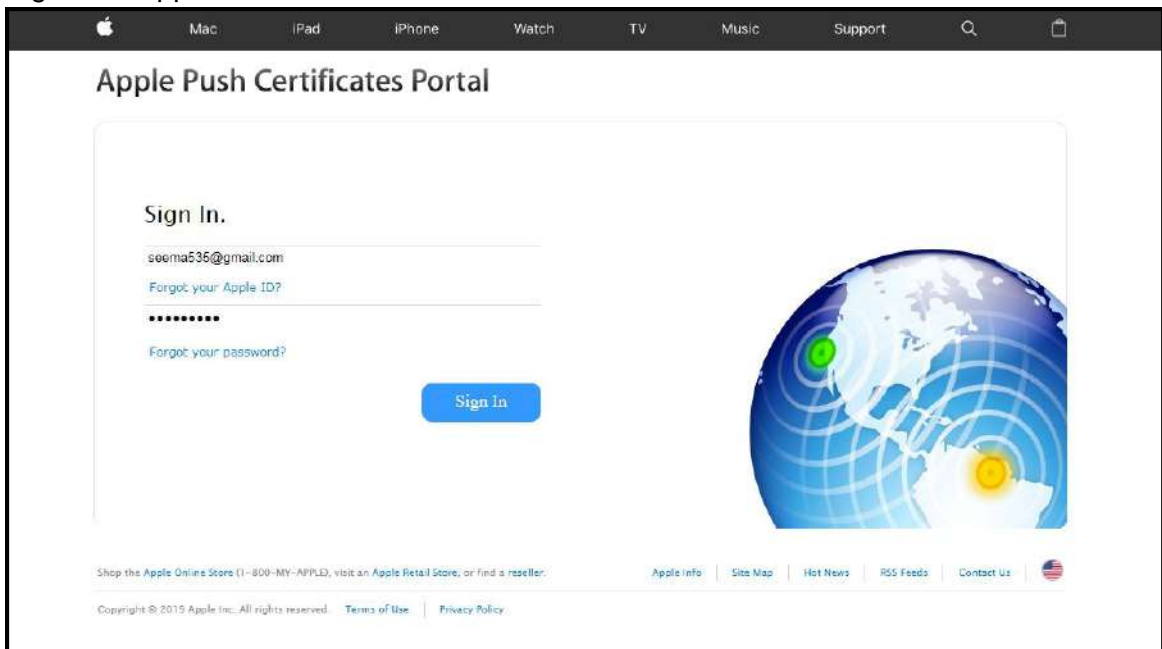

8. Click Continue.

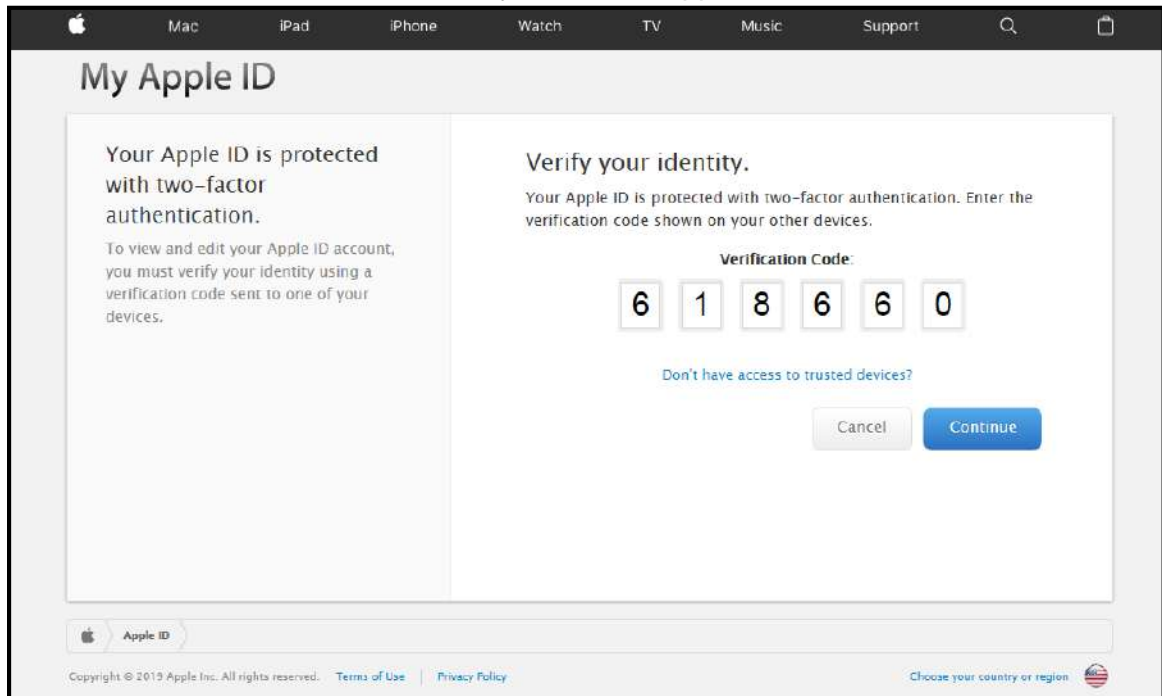

1. Provide your Corporate Apple ID. Click on Apple Push Certificates Portal.

2. Sign In to Apple Push Certificates Portal.

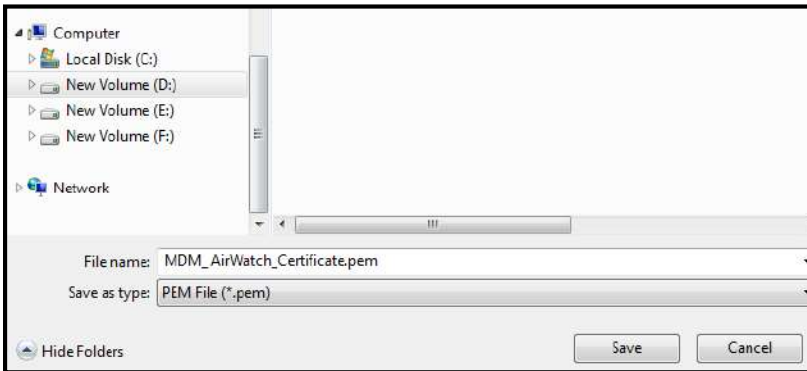

- Enter the Verification Code shown on your trusted Apple device.

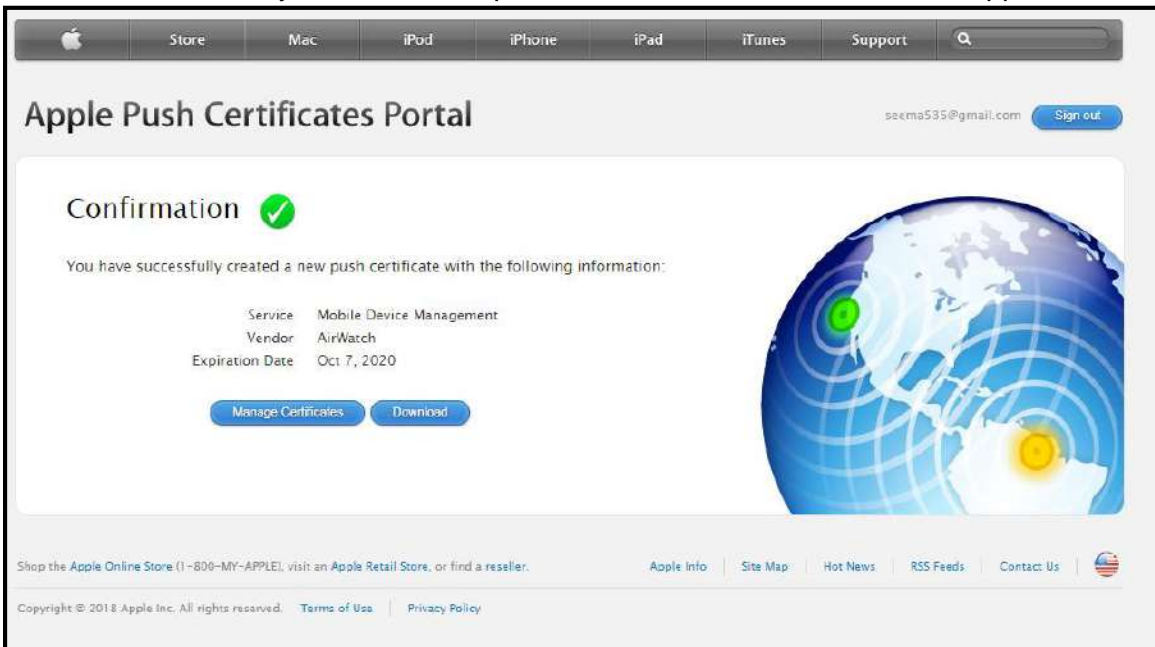

- Click to Save your MDM\_AirWatch\_Certificate.

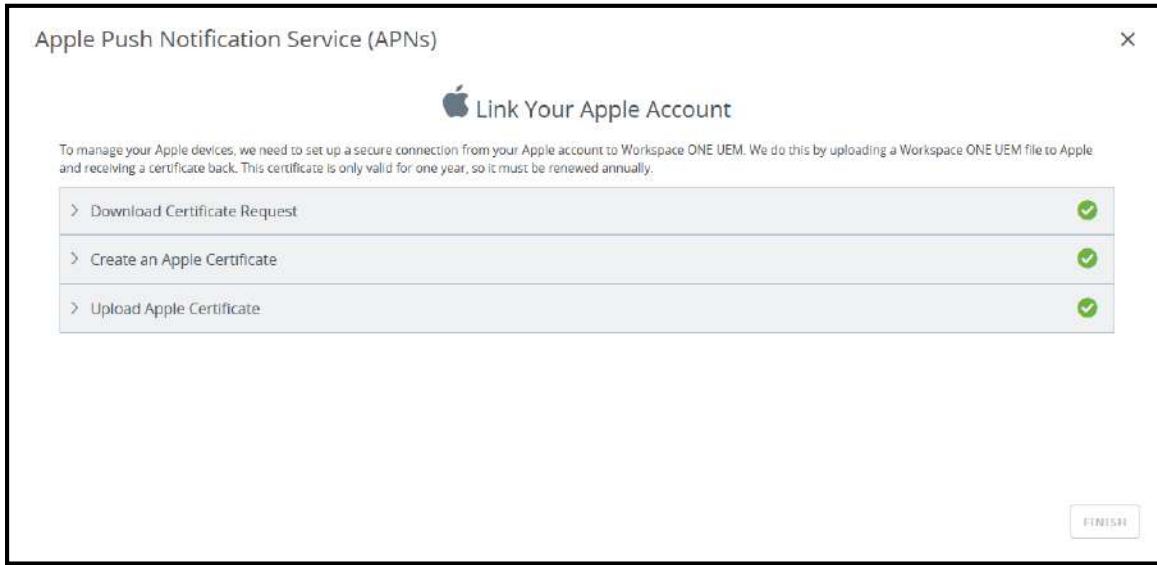

- Browse a file path to save MDM\_AirWatch\_Certificate.

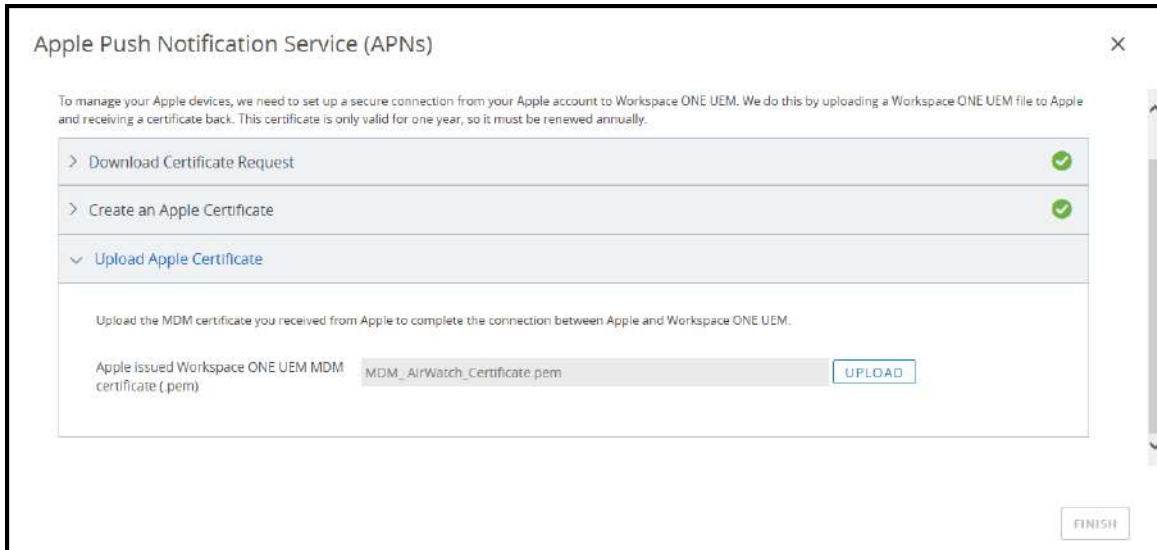

- You have successfully created a new push certificate Confirmation screen appears.

- Go back to Workspace ONE UEM on the third step upload the Apple Certificate.

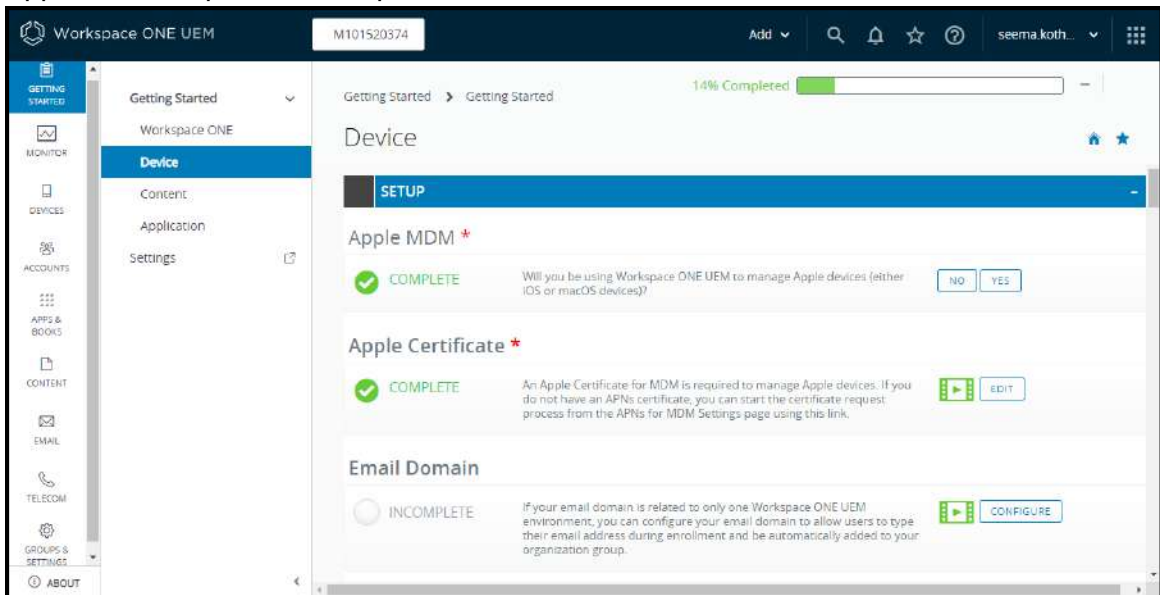

- Go back to Workspace ONE UEM. On the third step upload the Apple Certificate.

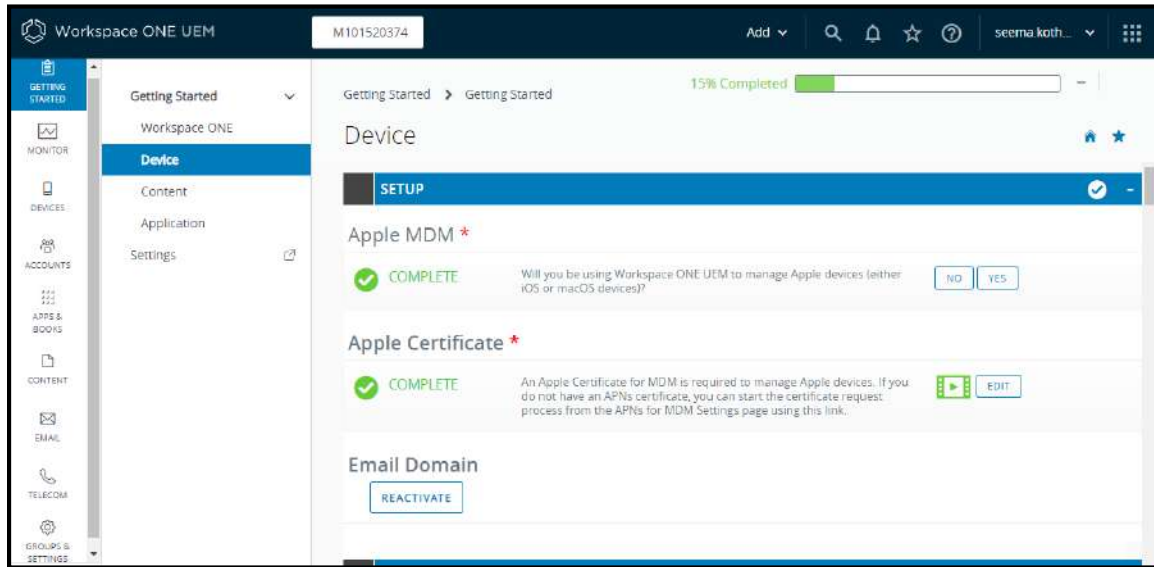

9. Apple issued certificate is successfully uploaded to Workspace ONE UEM MDM.

10. Apple MDM step is now complete.

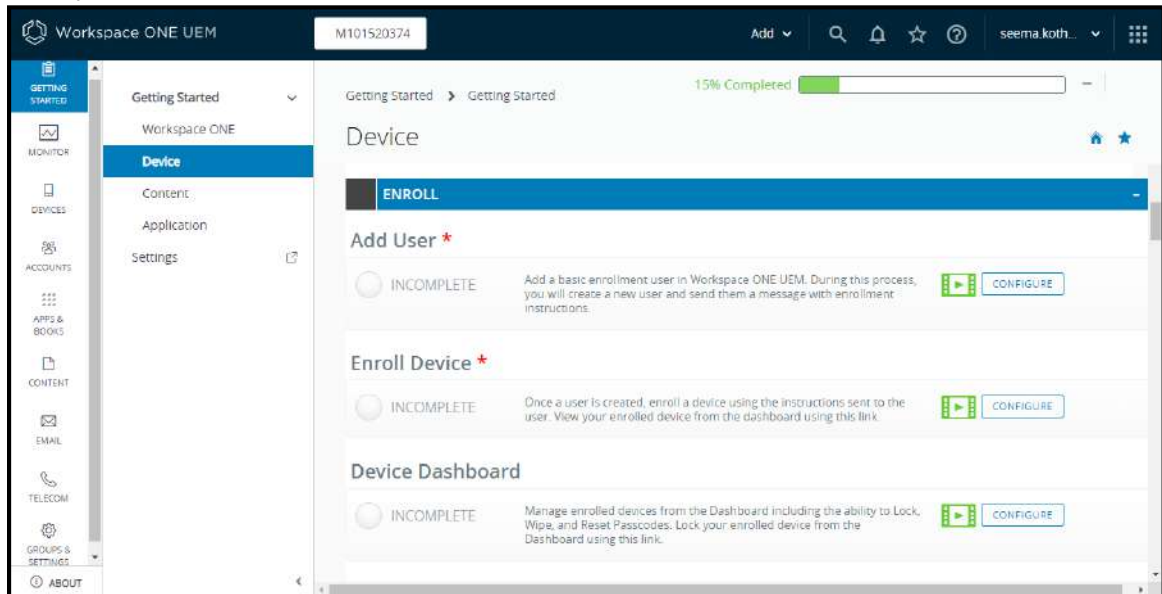

- You may Skip or configure Email Domain. In this case we have skipped configuring email domain.

## 9.2 Enroll Users

This section explains steps to enroll users for all devices.

- Next you can enroll users.

2. Provide the general user information.

6. For devices other than Apple you need not perform this step.
7. Go to the Enroll section and Add User. Add user to a Custom User Group. During this process you add a user and a Message sent to the user with enrollment instructions.
8. The next step is to complete Enroll Device as shown below.

## 9. Enrollment user receives email for Device Activation.

### 9.3 Enroll Device

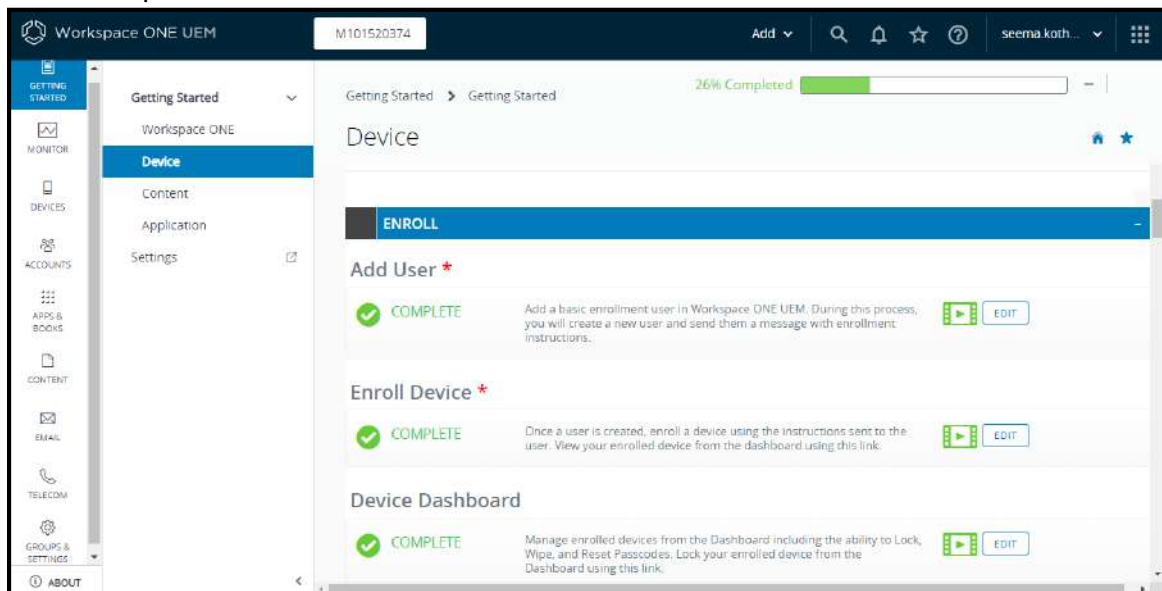

This section explains steps to enroll devices.

1. To enroll a device you first need to download Workspace ONE Intelligent Hub (AirWatch MDM Agent) on your device
2. Open the email sent to you above and follow the instructions to enroll your device.
3. Scan QR code or provide User/password. In case of Android device it is checked that the user should be assigned to a custom user group.
4. You are redirected to the server URL.
5. Profile will be downloaded.

6. Install the profile.
7. Create a passcode.
8. You can see the screen downloading configuration profile.
9. You now enter Workspace ONE Intelligent Hub using credentials sent on an email.
10. You may receive another email to reset your enrolled user password. Please reset your password.
11. You can now view Apps and Notifications on your mobile device.

## 9.4 Device Dashboard

1. You can now view your devices on the Device Dashboard. You can also start using Intelligent Hub and see Enterprise Applications as per roles assigned to the Custom User Group.

2. You can now start using the AirWatch Plugin steps.

## 10 Appendix 10: Google Refresh Token Generation

It is assumed that you have a Google developer console account created on <https://console.developers.google.com>.

In this Appendix we complete the Google Spreadsheet steps prerequisites.

- Enable APIs for Google Drive and Google Spreadsheet
- Generate Client ID and Client Secret
- Generate Refresh Token in exchange for the Client ID and Client Secret

### References

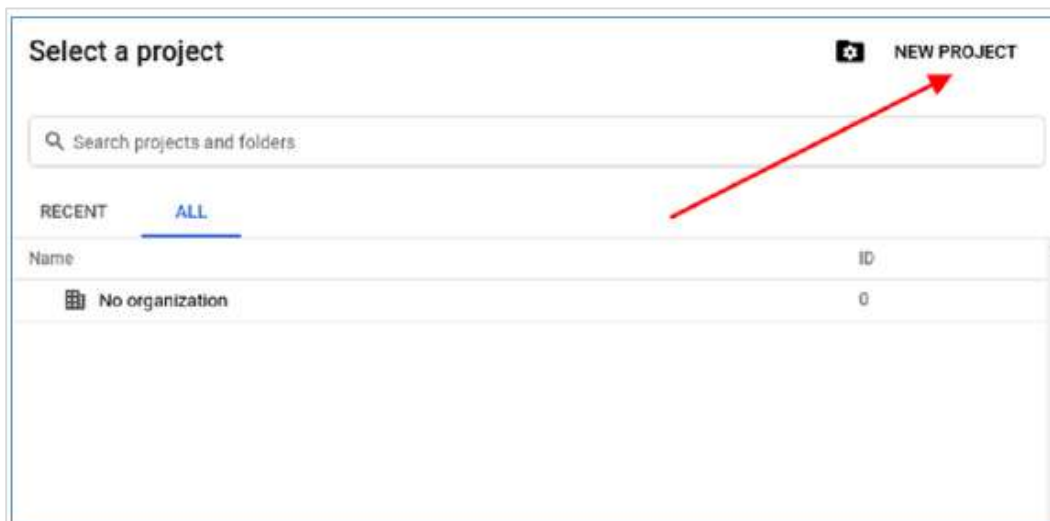

Google Spreadsheet documentation

<https://developers.google.com/sheets/api>

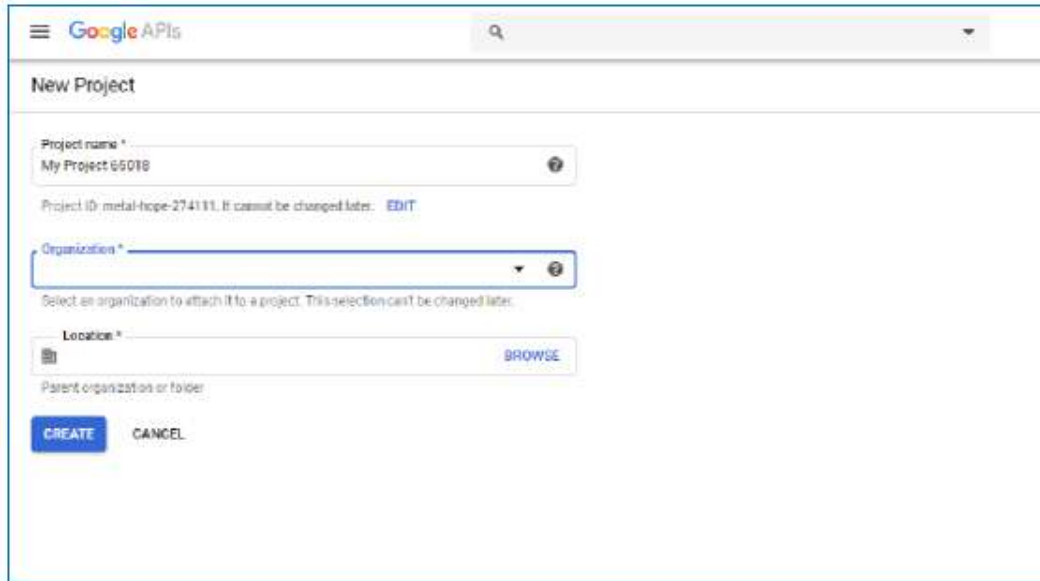

### 10.1 Enable APIs

In this section we will Enable APIs for Google Drive and Google Spreadsheet.

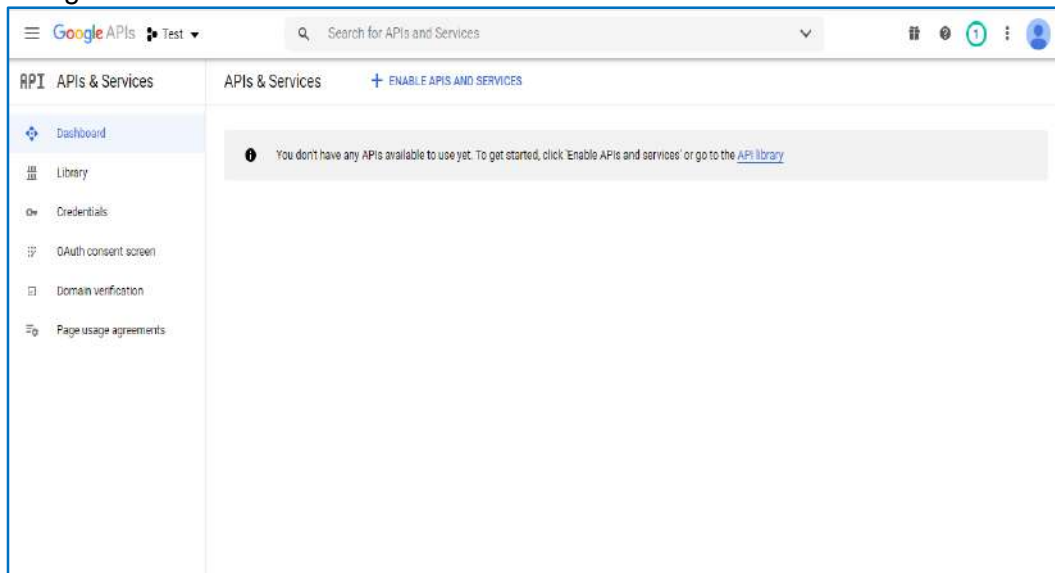

1. Go to the [Google Developer Console](#).
2. Click **Select a Project >> New Project**. If you have an existing project, you can select it from **ALL**.

3. Provide valid values and Click on the **CREATE** button.

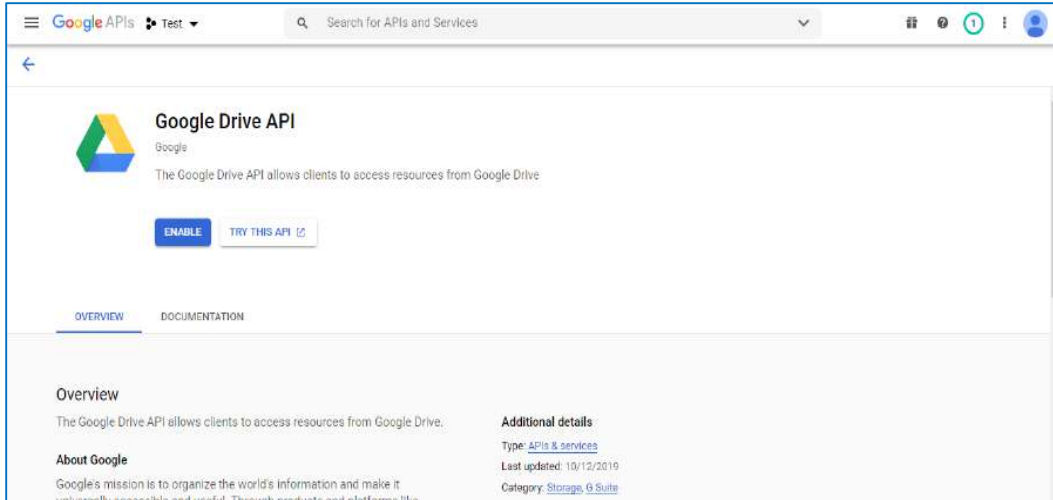

4. Navigate to **Dashboard** and Click on **ENABLE APIS AND SERVICES**.

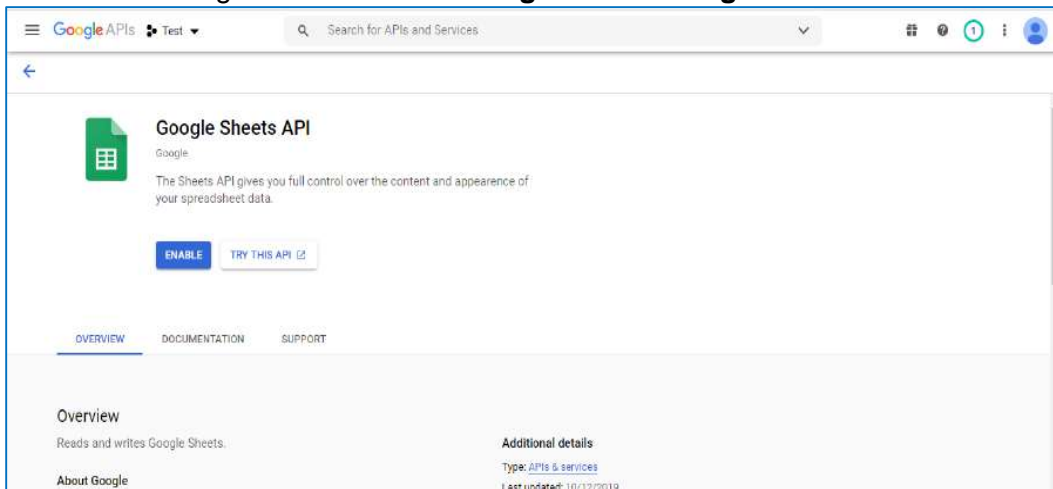

5. Search for **Google Drive API** for Google Drive Plugin >Click on **ENABLE**.

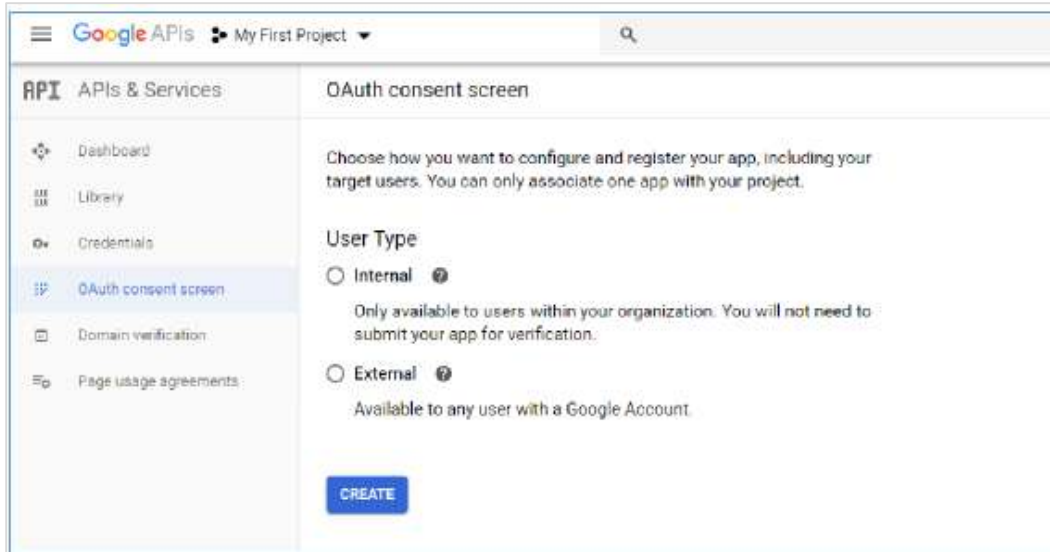

6. Search for Google Sheets API for **Google Sheets Plugin** >Click on **ENABLE**.

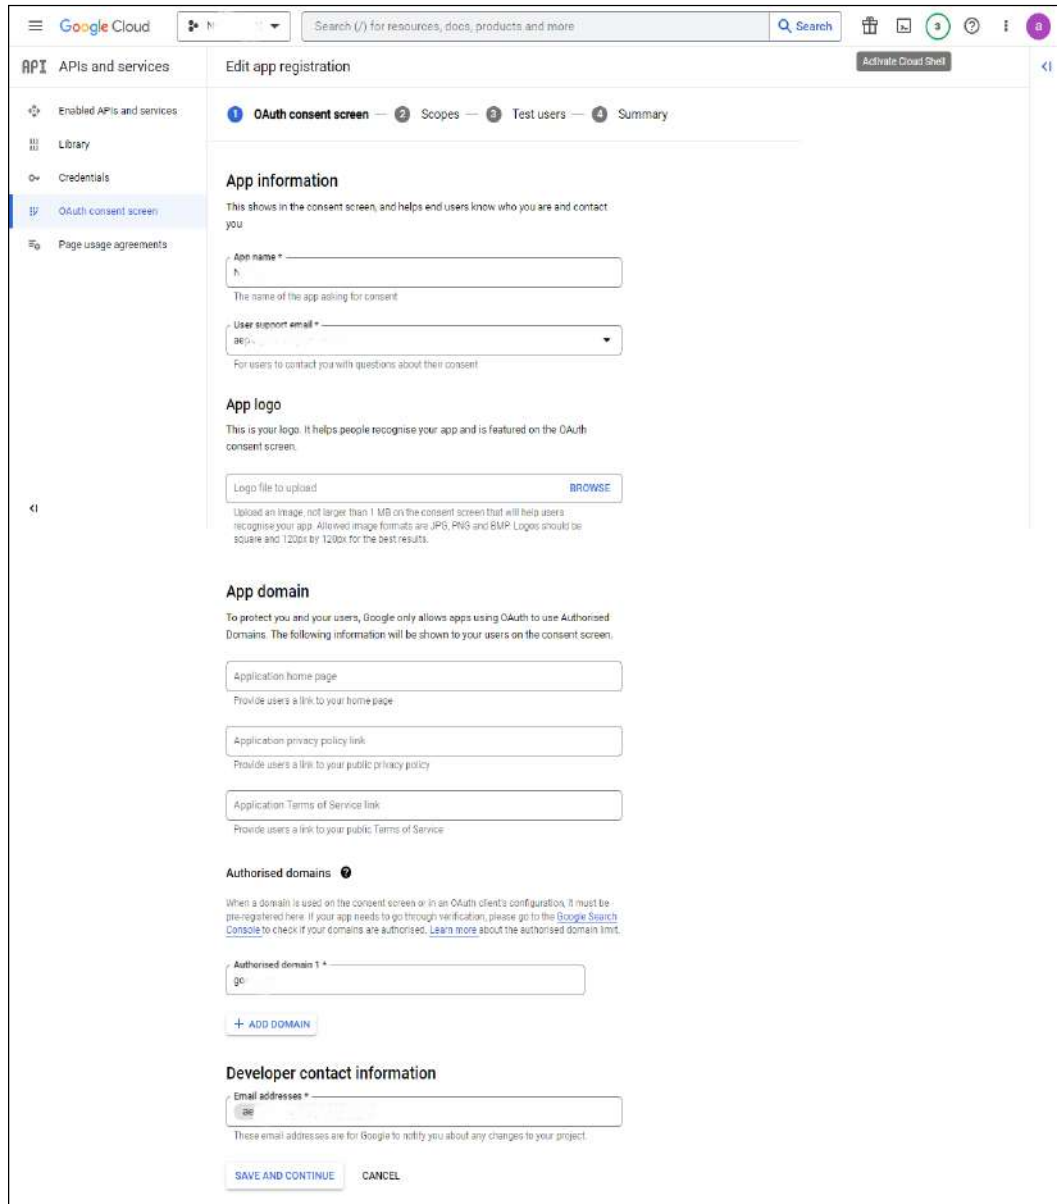

## 10.2 Procedure to get a Client ID and Client Secret

1. Navigate to the tab **OAuth consent screen** and choose the valid option.

2. Enter the **App name, User support email, Authorized domains, Developer contact information** > click **SAVE AND CONTINUE** button.

3. Click on **ADD OR REMOVE SCOPES** button.

### Edit app registration

✓ OAuth consent screen — **2** **Scopes** — 3 Test users — 4 Summary

Scopes express the permissions that you request users to authorise for your app and allow your project to access specific types of private user data from their Google Account. [Learn more](#)

**ADD OR REMOVE SCOPES**

4. Select Google Drive API and scope selected in following image > click **UPDATE** button > click **SAVE AND CONTINUE** button.

**Manually add scopes**

If the scopes that you would like to add do not appear in the table above, you can enter them here. Each scope should be on a new line or separated by commas. Please provide the full scope string (beginning with 'https://'). When you are finished, click 'Add to table'.

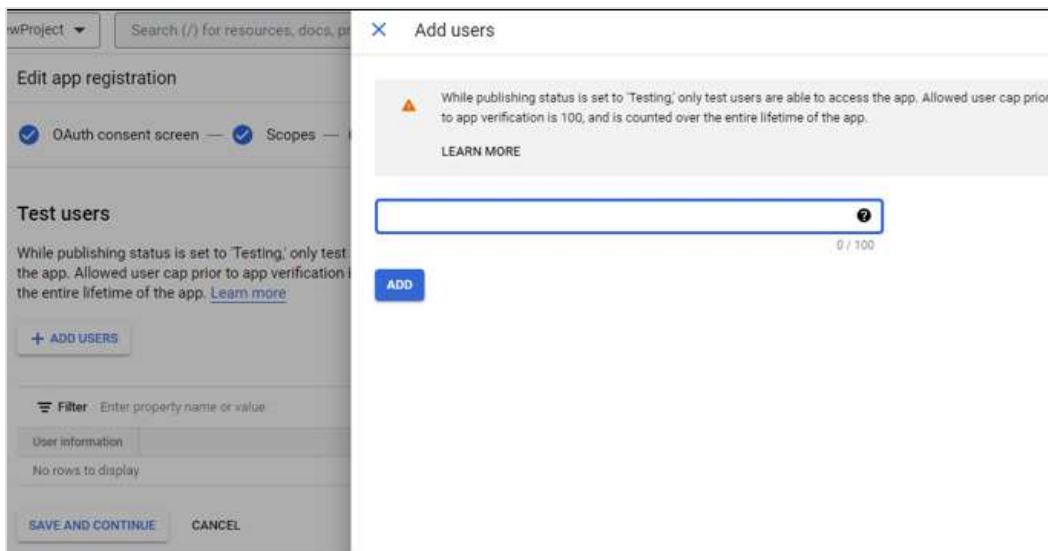

ADD TO TABLE

UPDATE

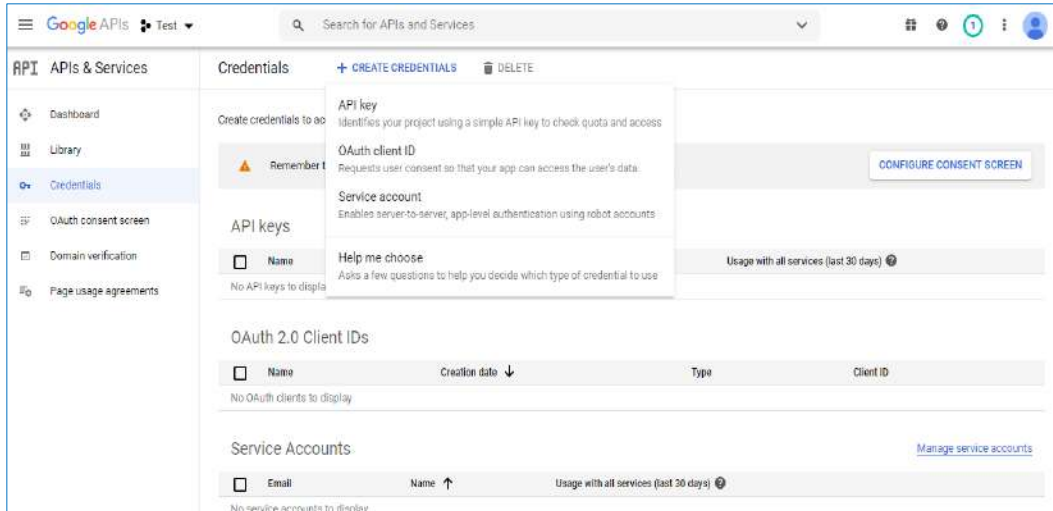

5. Click on **ADD USERS** button.

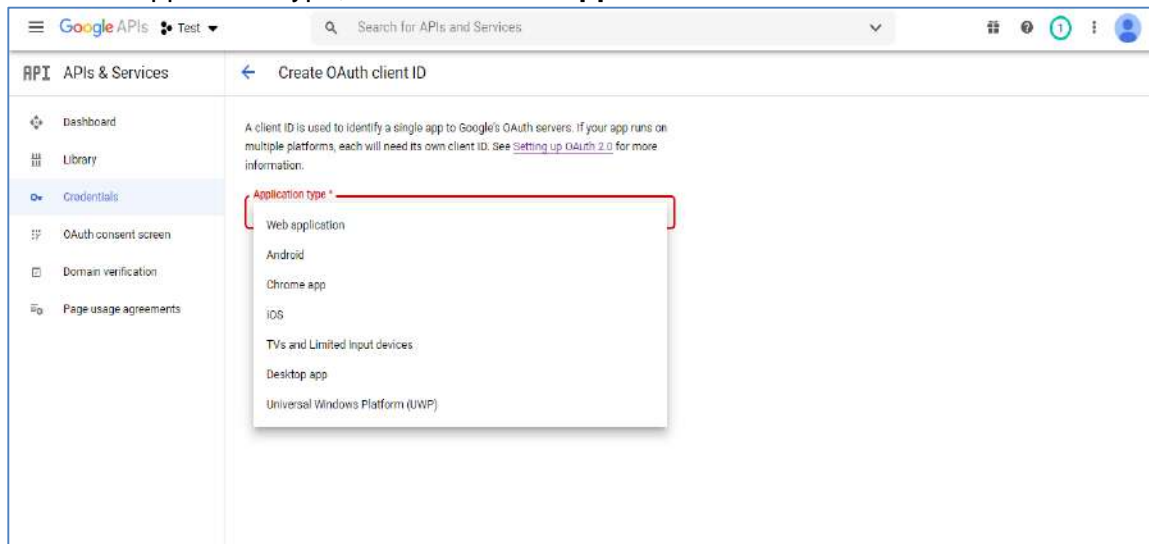

6. Provide valid email ID > click **ADD** button > click **SAVE AND CONTINUE** button.

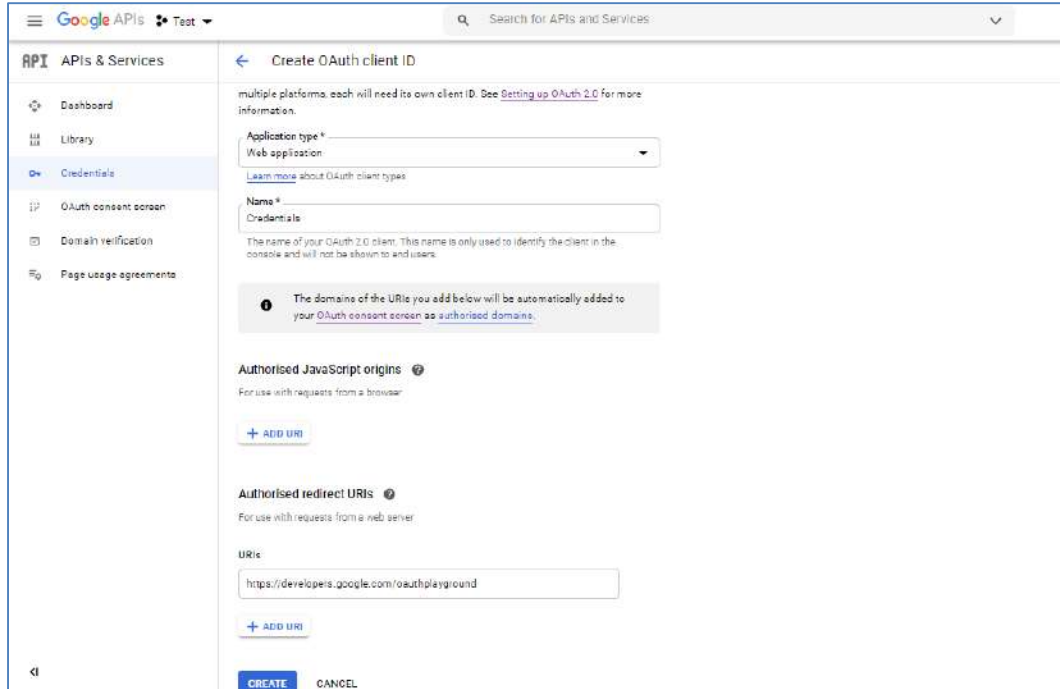

7. Click on **Credentials** tab > click **CREATE CREDENTIALS** and from the dropdown-list select **OAuth client ID**.

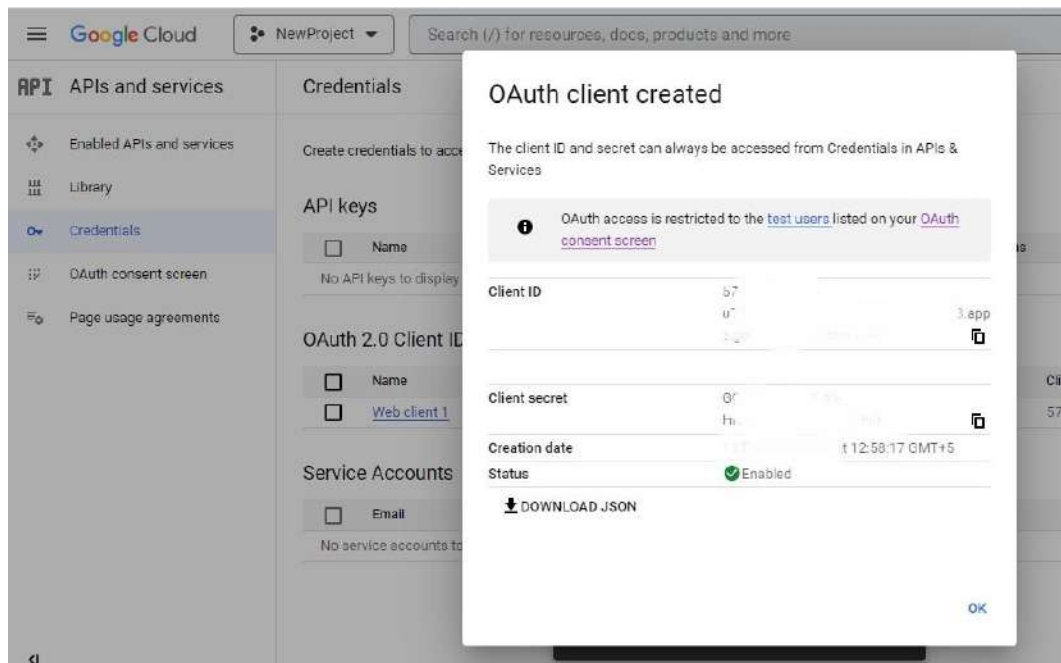

8. From the Application type, select the **Web Application**.

9. Enter valid **Name** and **Authorized Redirect URIs** > Click **CREATE** button.  
 Authorized Redirect URIs: <https://developers.google.com/oauthplayground>

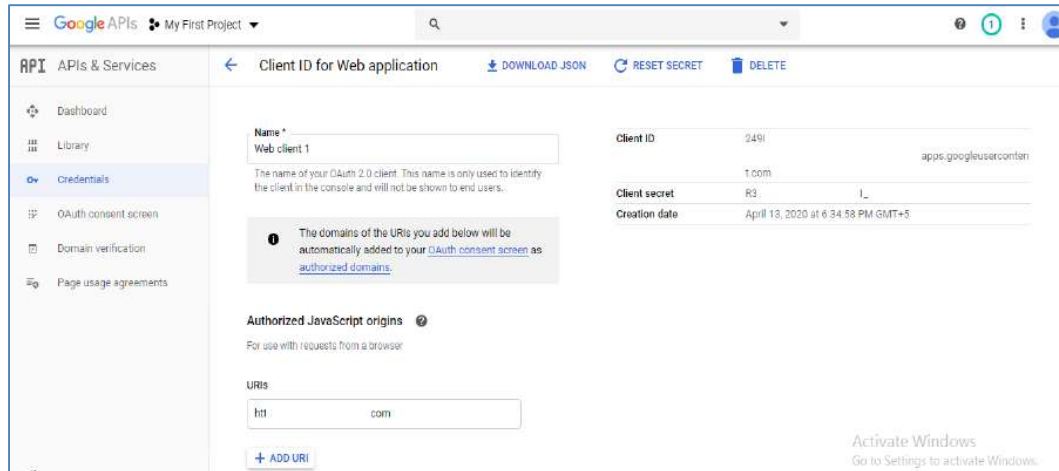

10. Copy **Client ID** and **Client Secret** > click **OK** button.

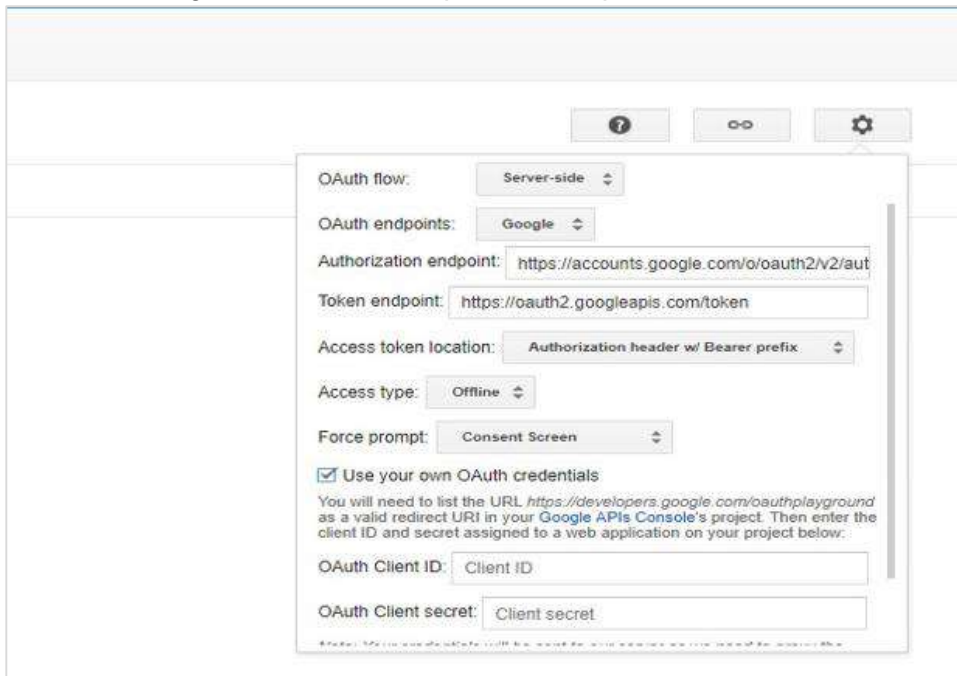

11. Get Client ID and Client Secret by clicking on the **OAuth 2.0 Client IDs**.

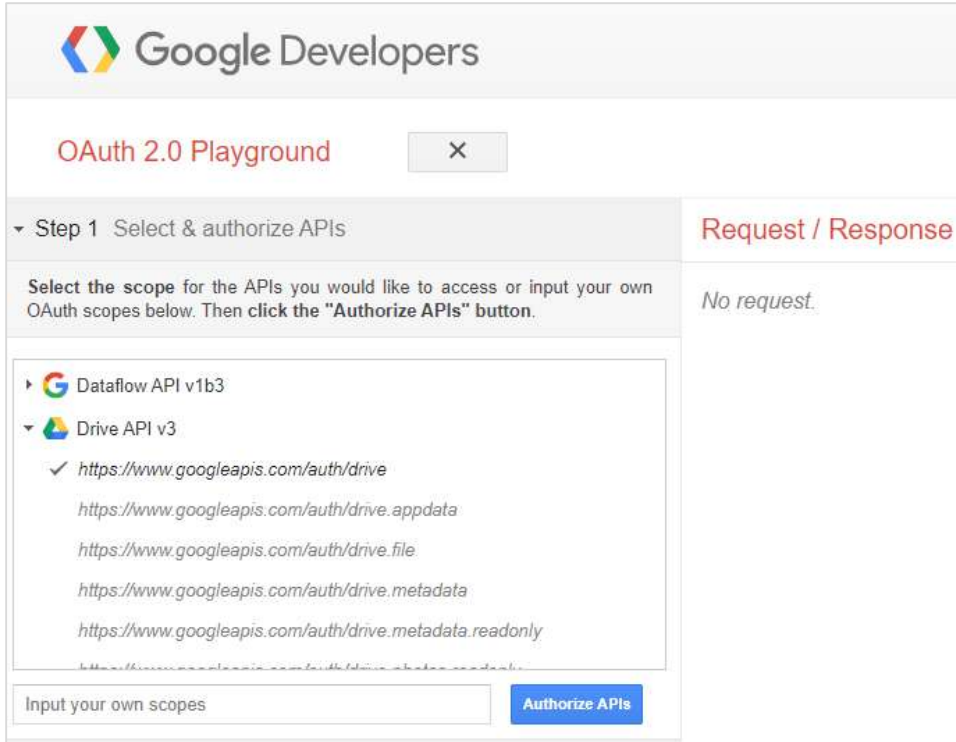

### 10.3 Procedure to generate Refresh Token

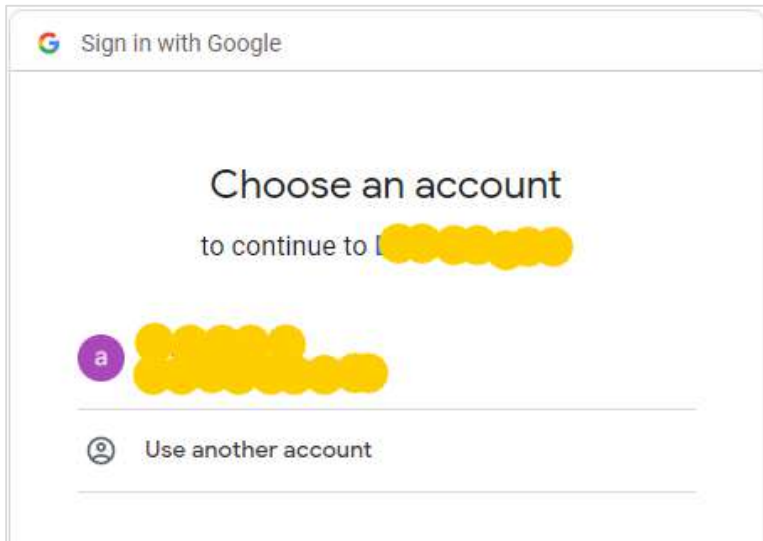

1. Go to the [Google OAuth Playground](#).
2. Click on the **Settings** icon.
3. Click on **Use your own OAuth credentials** and enter **OAuth Client ID** and **OAuth Client secret** generated from the previous step.

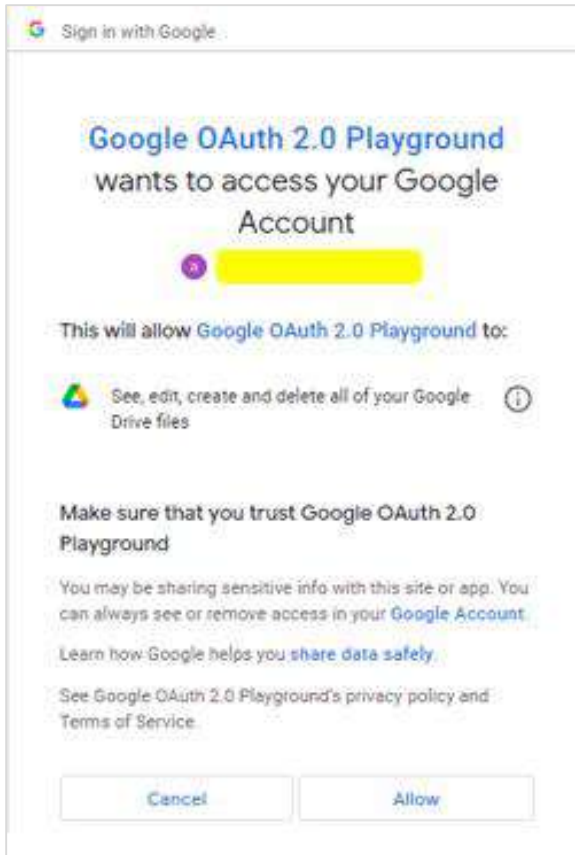

4. Select the **Select & authorize APIs**. Select the desired scope you want for your application (like: <https://www.googleapis.com/auth/drive> ) > click **Authorize APIs**.

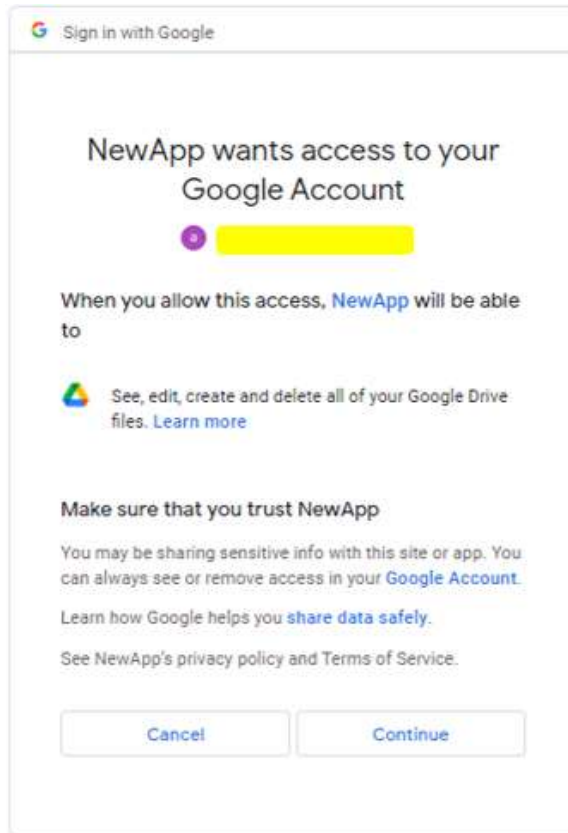

5. Choose an Account

6. Sometimes following screen appears > click **Allow**

7. Following consent screen appears, then click on **Continue**.

8. Click on **Exchange authorization code for tokens**.

▼ Step 2 Exchange authorization code for tokens

Once you got the Authorization Code from Step 1 click the **Exchange authorization code for tokens** button, you will get a refresh and an access token which is required to access OAuth protected resources.

Authorization code:

**Exchange authorization code for tokens**

Refresh token:

Access token:

Auto-refresh the token before it expires.

The access token will expire in **3587** seconds.

*Note: The OAuth Playground will automatically revoke refresh tokens after 24h. You can avoid this by specifying your own application OAuth credentials using the Configuration panel.*

9. You'll get the Authorization code, Click on the **Exchange authorization code for tokens** button.
10. Copy the **Refresh Token**.

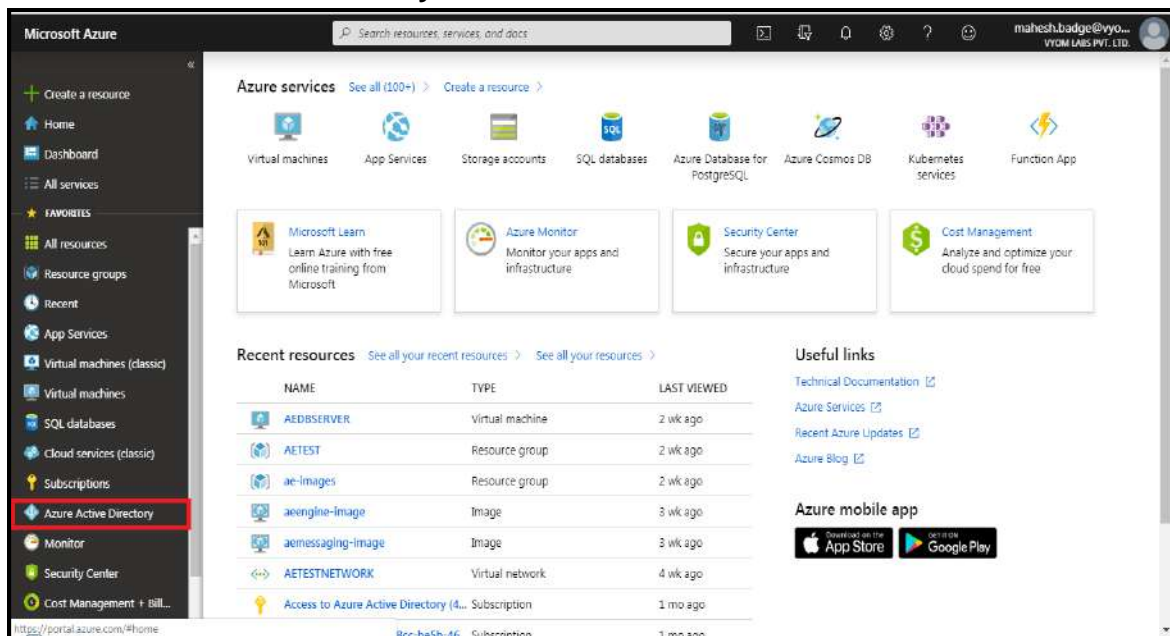

## 10.4 Refresh Token Expiration

<https://developers.google.com/identity/protocols/oauth2#expiration>

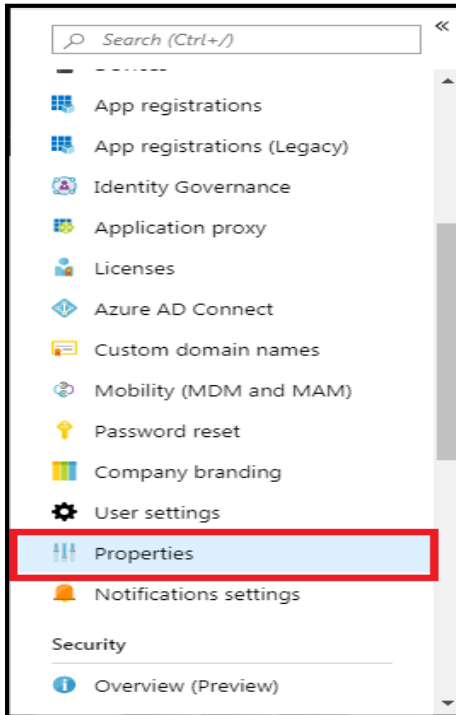

# 11 Appendix 11: Intune- Generate Client Credentials

In this Appendix we will see how to generate Client Credentials and provide necessary permissions.

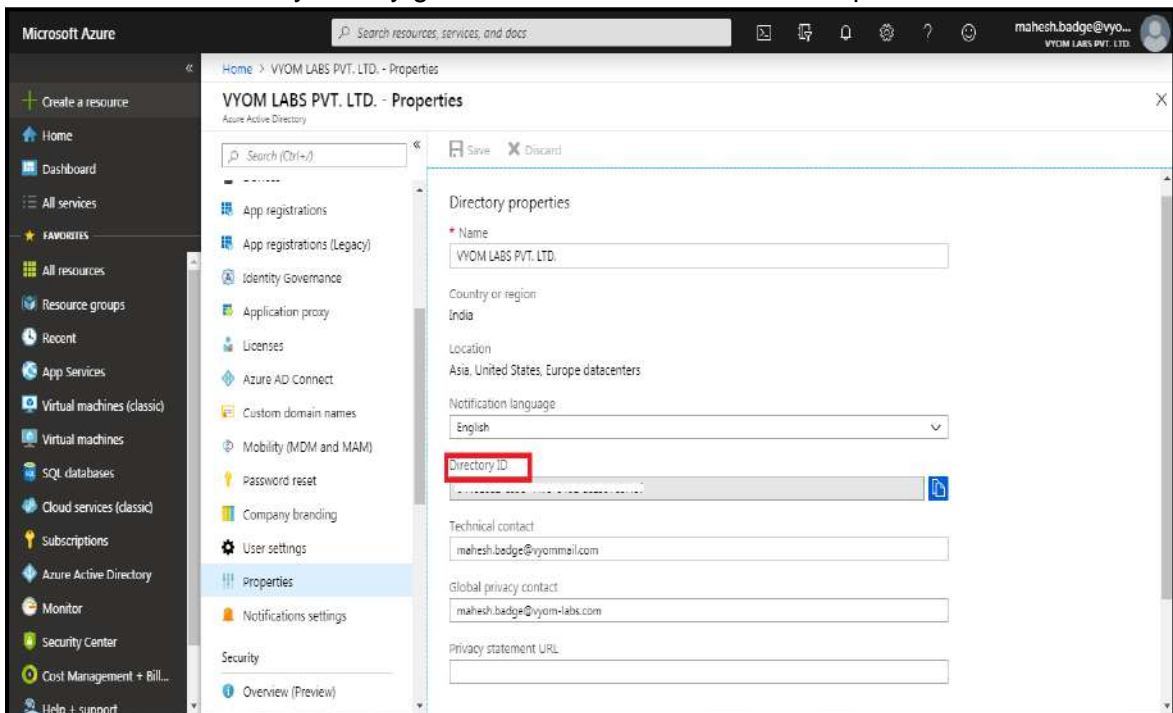

1. Login to <https://portal.azure.com> with email address and password (else register for a new account).
2. Click on **Azure Active Directory** from a column on the left side as below.

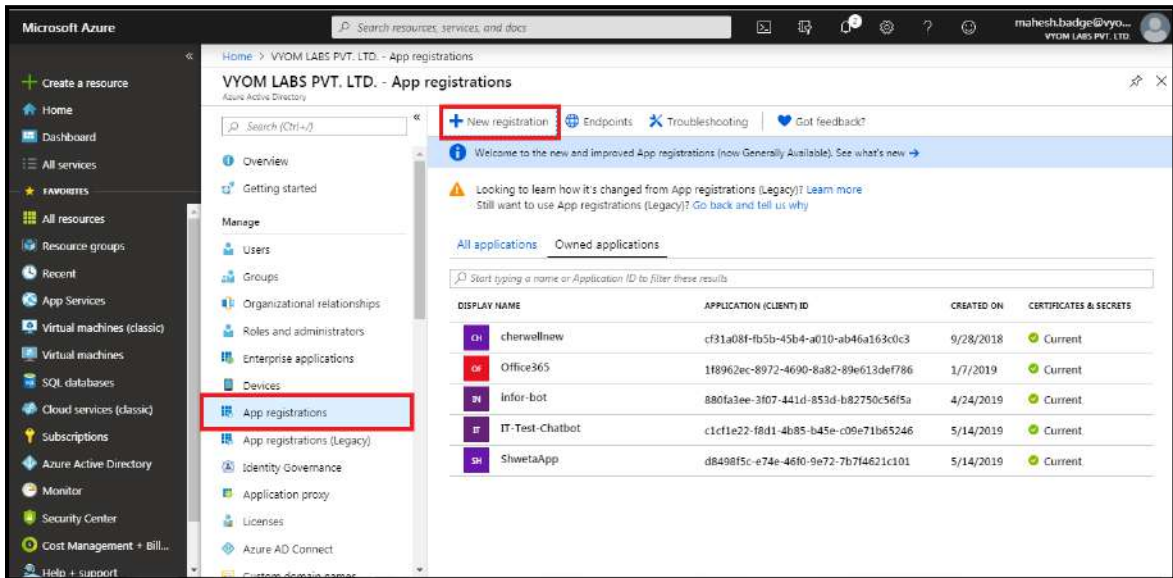

### 3. Search for Properties

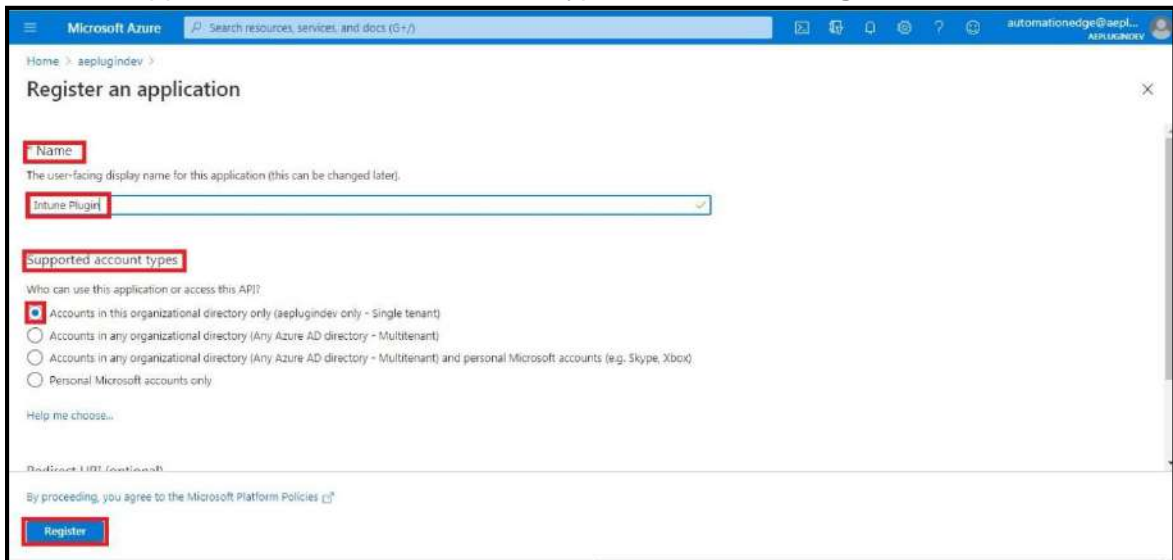

4. The **Tenant ID** required in the plugin is the ID mentioned under **Directory ID**. In case the ID is not available you may get Tenant ID as mentioned in step 8 below.

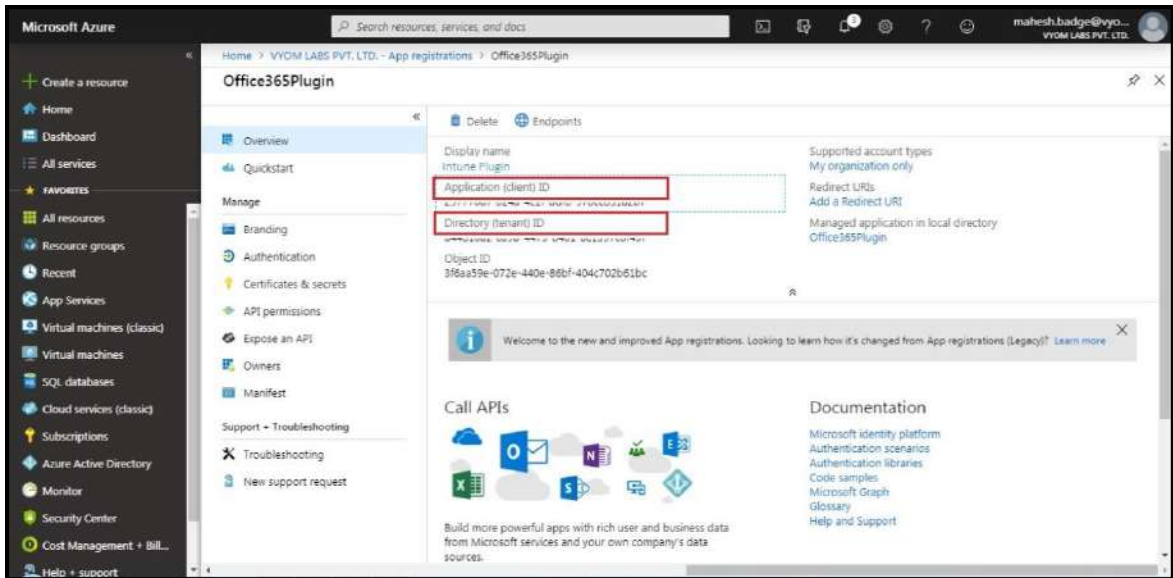

- To get the **Client ID**, click on **App registrations** under **Azure Active Directory**.
- Create a new App by clicking on **New Registration**.

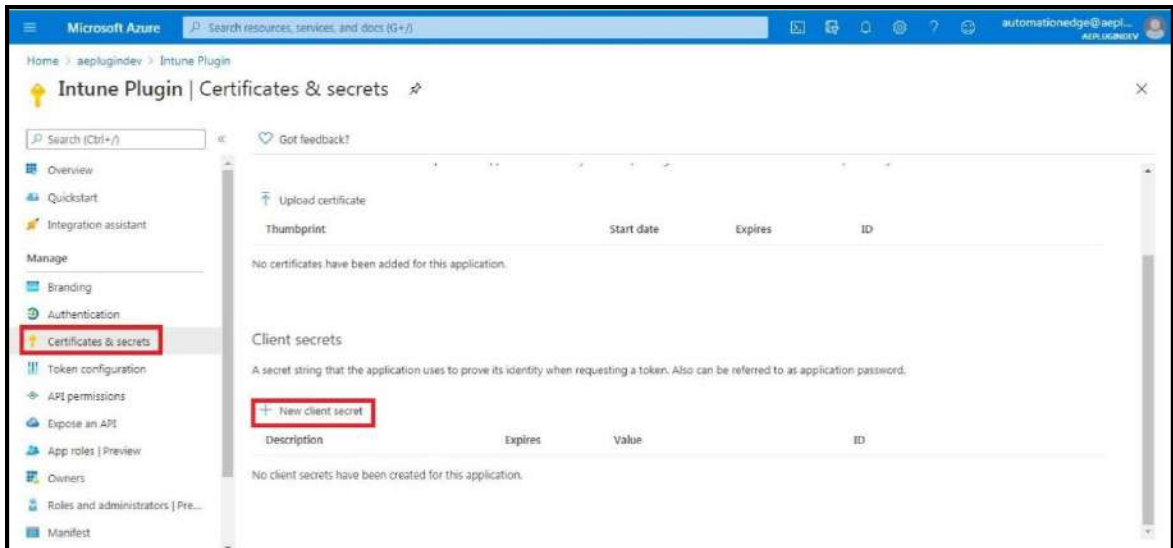

- Enter the application name select account types and click on **Register**.

- After clicking on **Register**, under **Overview** of the newly generated Application you can find the **Application (client) ID/ Client ID**. Also, you can find **Directory (tenant) ID/Tenant ID** below Client ID.

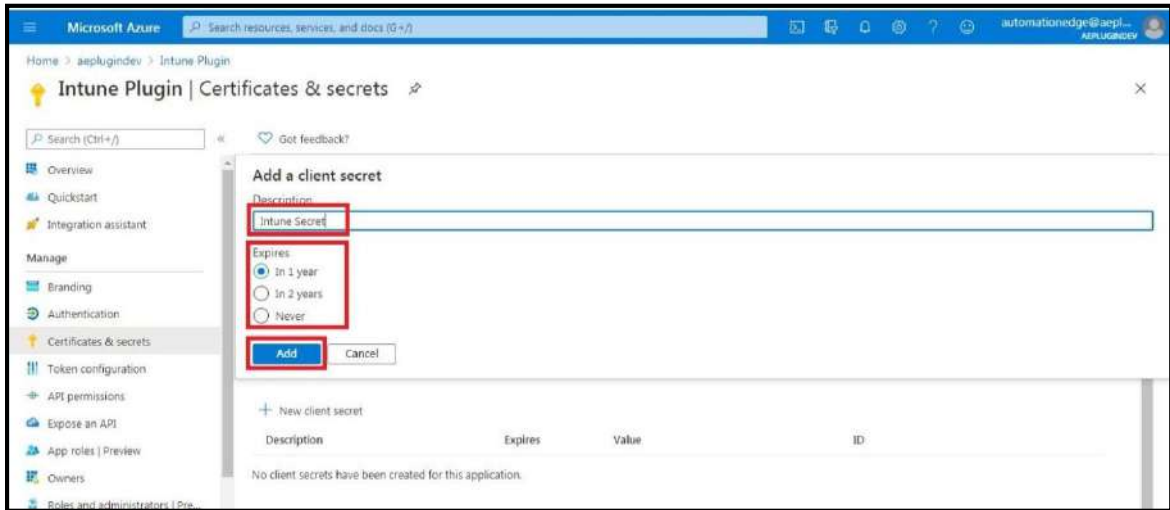

- To generate client secret, click on the **Certificates & Secrets** and then click on **+ New Client Secret**.

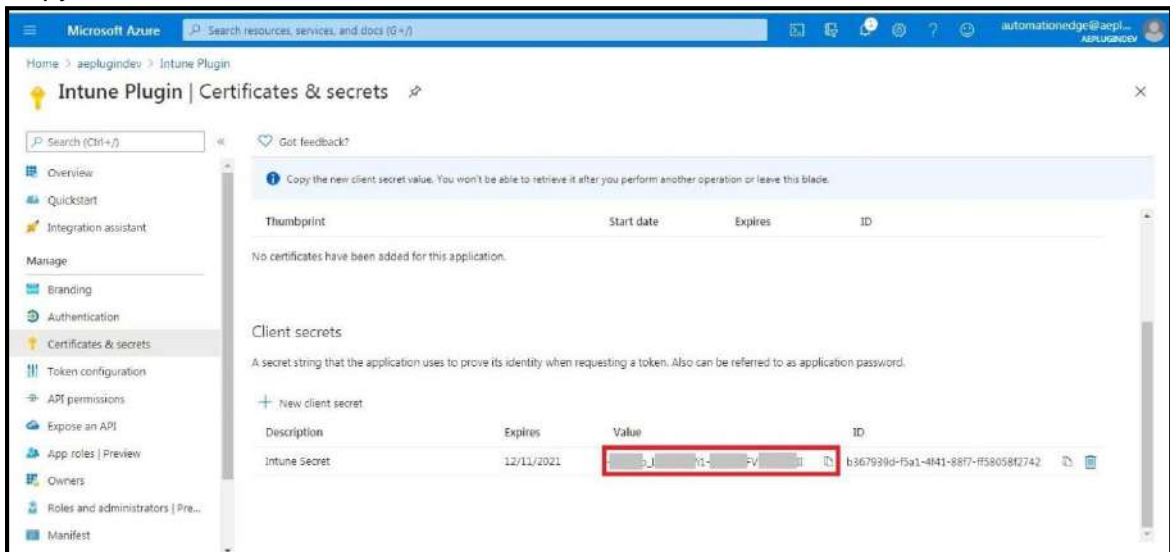

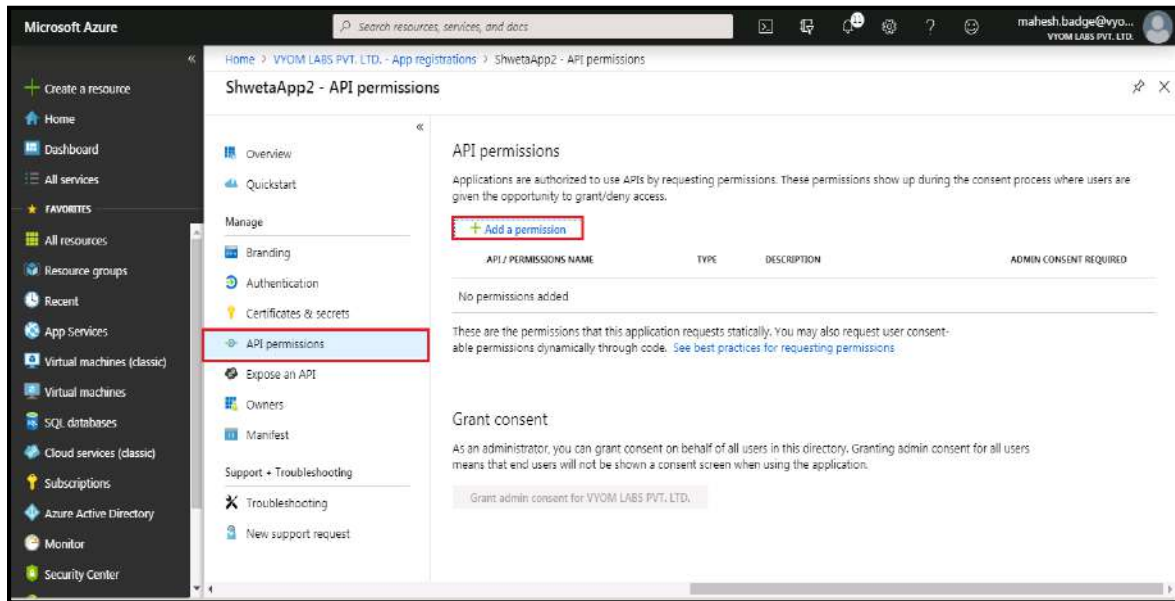

10. Now enter the **Description**, **Expiry**, and click on **Add**.

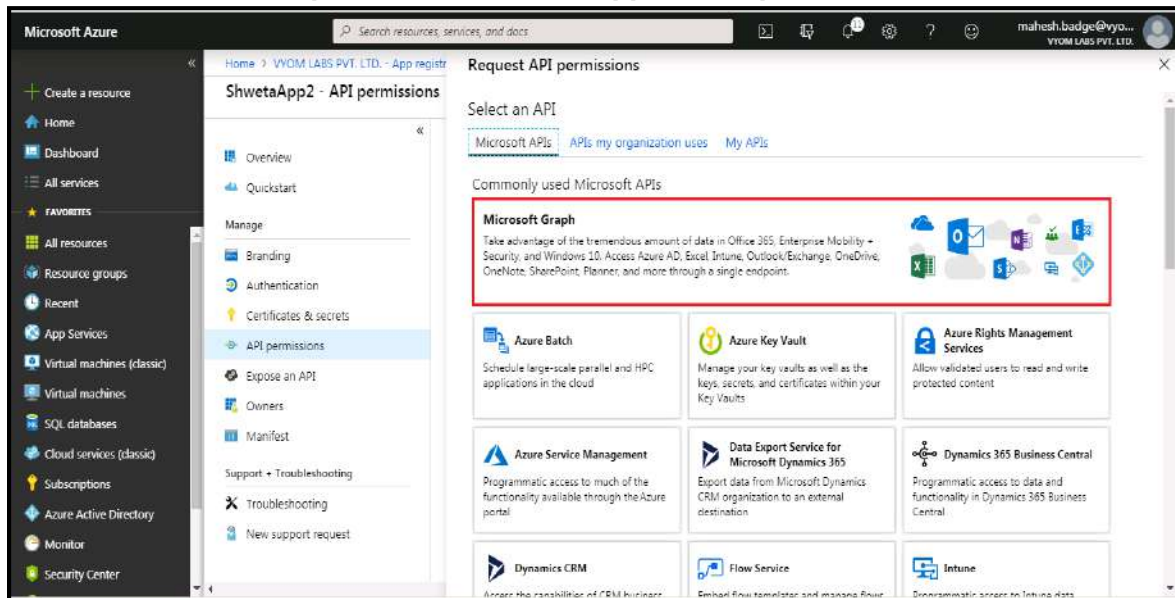

11. Copy the value of the client secret as it will be not visible the second time.

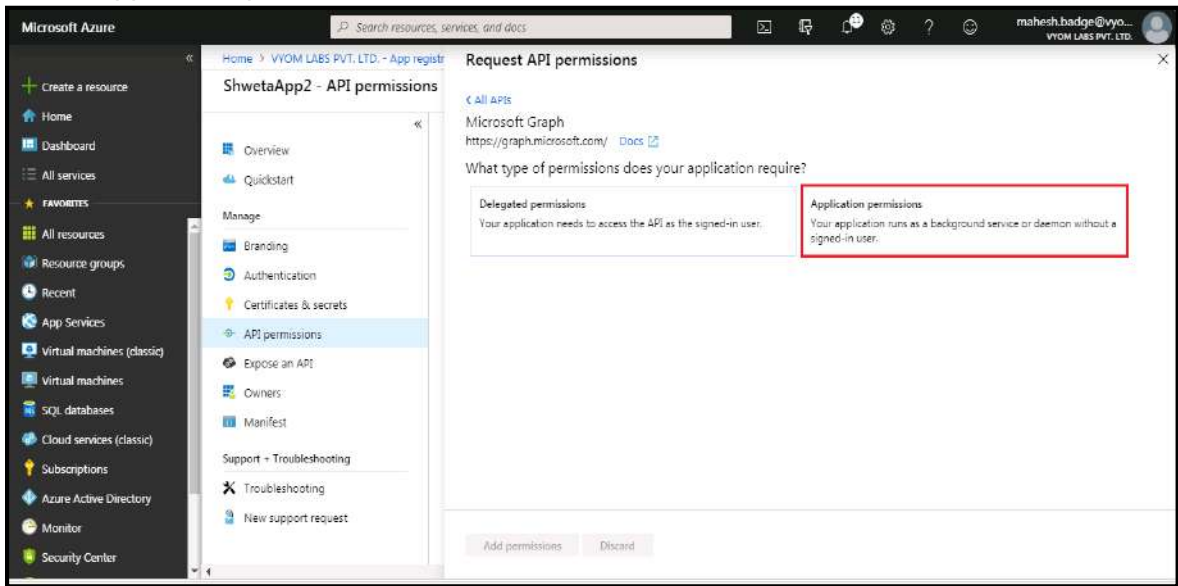

12. Click on **API Permission** and then click on **Add Permission**.

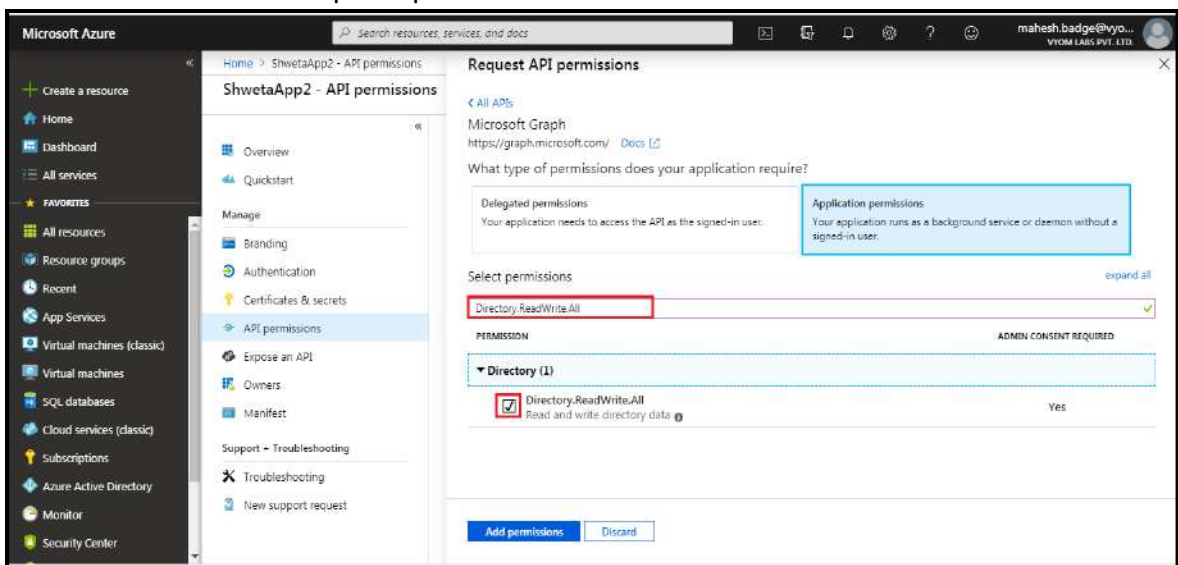

13. Click on **Microsoft Graph**, and then click on **Application permissions**.

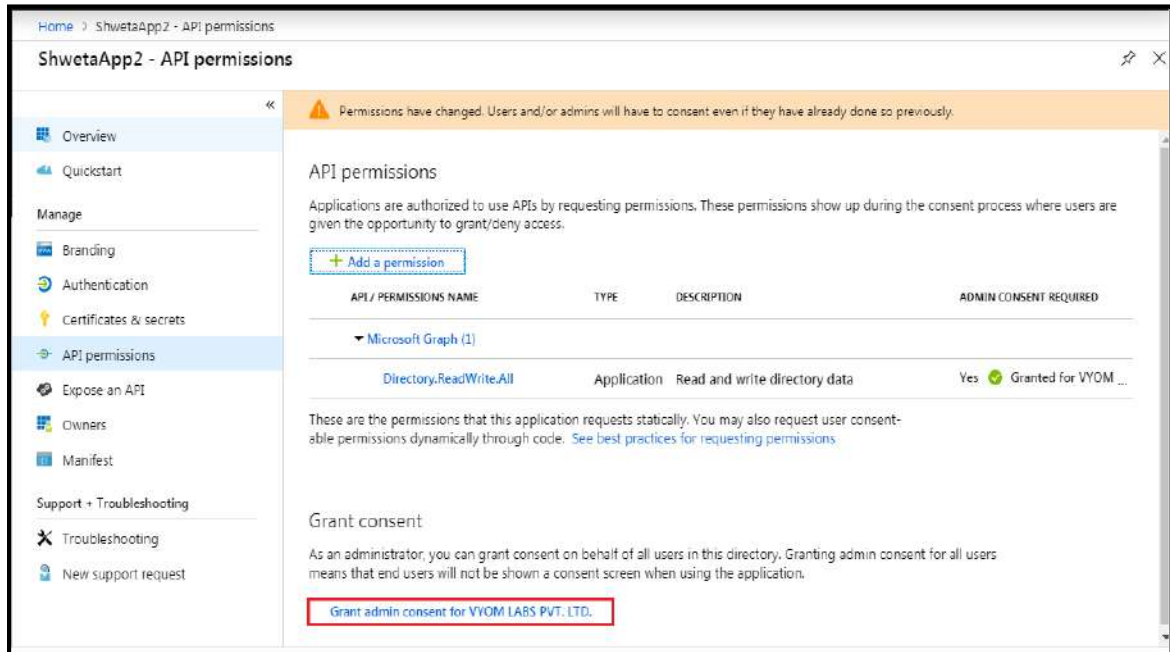

### 14. Select Application permission.

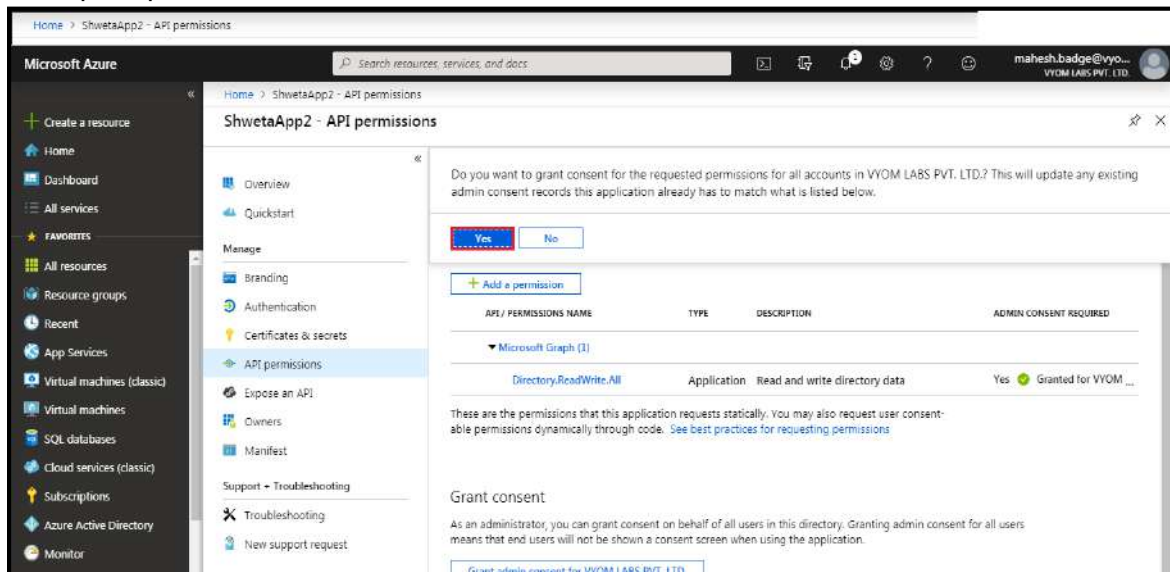

### 15. Search and select the required permission. Click on **Add Permission**.

16. This will redirect back to API Permission. In the **Grant Consent** section click on **"Grant admin consent for...."**.

17. It will prompt for confirmation, click on **Yes**.

18. Similarly, we can assign the permissions required by Intune Plugins mentioned below,

- DeviceManagementManagedDevices.PrivilegedOperations.All
- DeviceManagementManagedDevices.ReadWrite.All

## 12 Appendix 12: OneDrive Refresh Token

### Refresh Token for connection to OneDrive:

In One Drive Plugin Connection Configuration we need to provide connectivity details for a OneDrive instance as mentioned in the table below.

#### Connection Details:

| No. | Field Name      | Datatype | Mandatory? | Description                                                                     |
|-----|-----------------|----------|------------|---------------------------------------------------------------------------------|
| 1.  | Client ID       | String   | --         | Client ID provided by Azure Active Directory.                                   |
| 2.  | Refresh Token   | String   | Yes        | Refresh Token provided by authorization grant flow discussed in sections below. |
| 3.  | Test Connection | Button   | --         | Verifies whether the connection is established or not.                          |

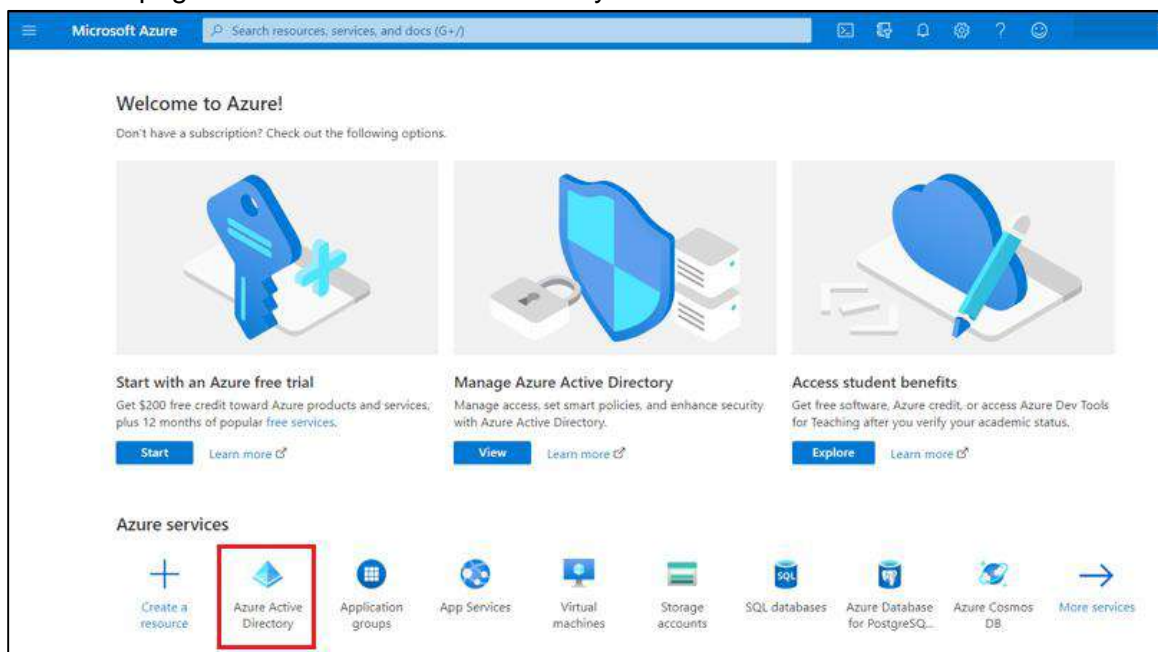

Following are the steps for app setup and generating refresh token for OneDrive plugins,

- i. Register app for OneDrive on Azure AD
- ii. Generate Refresh Token for OneDrive

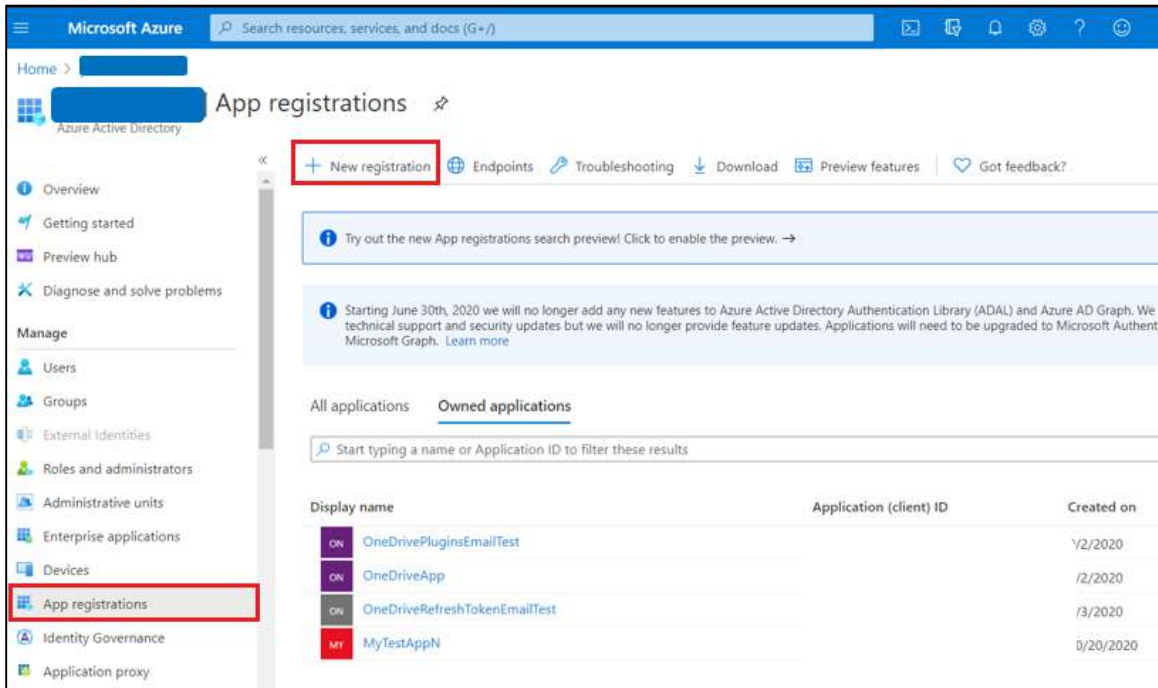

These are discussed below,

### 12.1 Register app for OneDrive on Azure AD

1. On Home page click on Azure Active Directory.

2. Click on App registrations in the left menu, and click New Registration.

3. Provide an application name. Click Register.

## Register an application ...

**\* Name**  
The user-facing display name for this application (this can be changed later).

Test OneDrive ✓

**Supported account types**  
Who can use this application or access this API?

Accounts in this organizational directory only (yanoso9863 only - Single tenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant) and personal Microsoft accounts (e.g. Skype, Xbox)  
 Personal Microsoft accounts only

[Help me choose...](#)

**Redirect URI (optional)**  
We'll return the authentication response to this URI after successfully authenticating the user. Providing this now is optional and it can be changed later, but a value is required for most authentication scenarios.

Public client/native (mobile ... ▾) https://automationedge.com ✓

Register an app you're working on here. Integrate gallery apps and other apps from outside your organization by adding from [Enterprise applications](#).

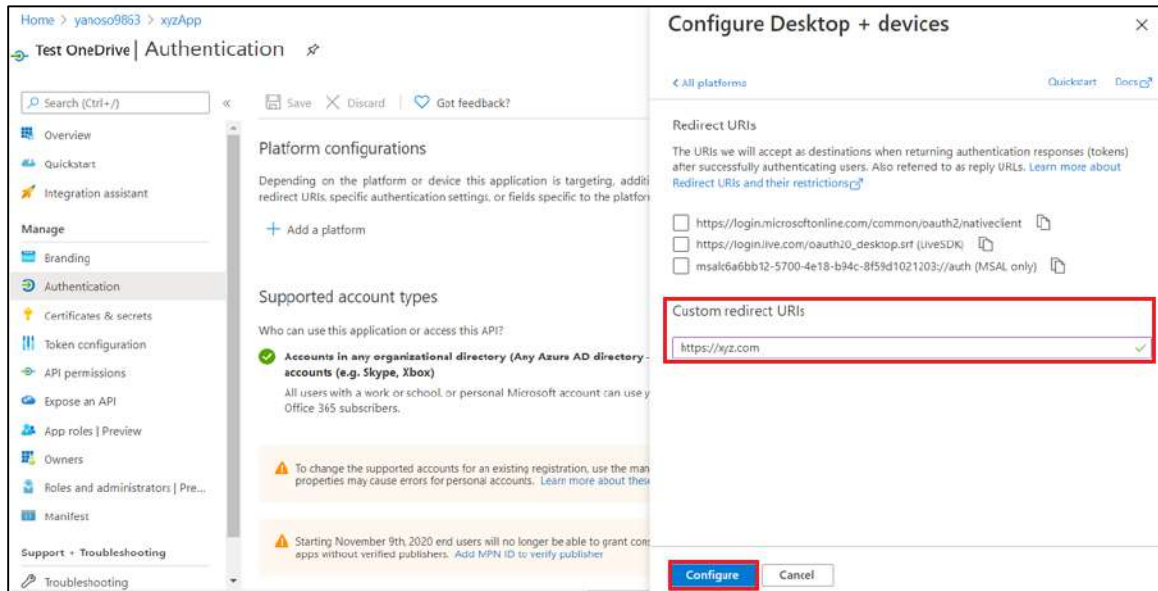

By proceeding, you agree to the [Microsoft Platform Policies](#)

**Register**

- Click Authentication in the left menu, and then click +Add a platform to open the Configure platforms pane.

The screenshot shows the Azure portal interface for configuring an application. On the left, the 'Authentication' menu item is highlighted with a red box. In the main content area, the 'Add a platform' button is highlighted with a red box. On the right, the 'Configure platforms' pane is open, showing two main categories: 'Web applications' and 'Mobile and desktop applications'. The 'Mobile and desktop applications' option is highlighted with a red box.

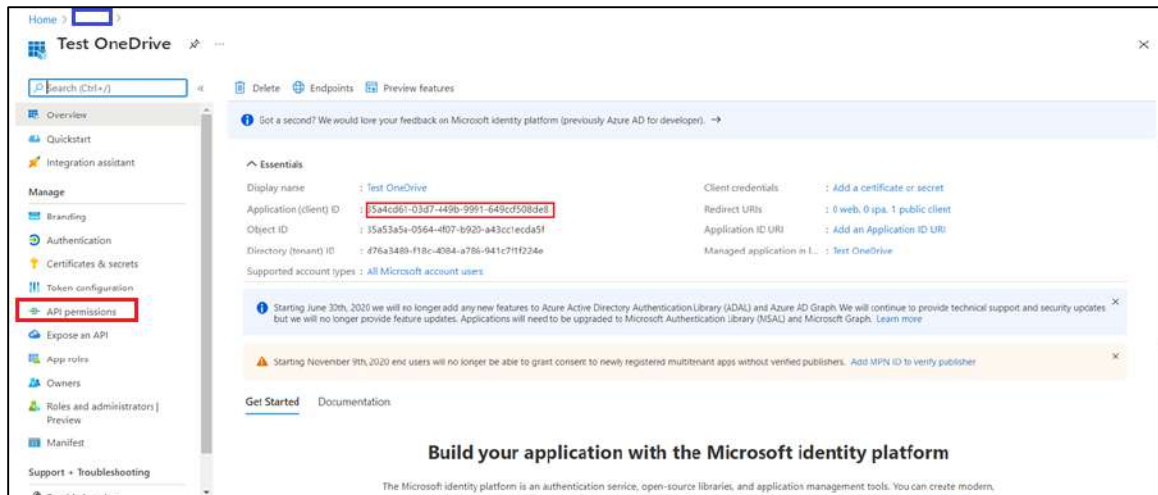

- In the Configure platforms pane, select Mobile and desktop applications.
- In the Configure Desktop + devices pane, provide valid 'Custom redirect URIs' to receive the authorization code (e.g. <https://automationedge.com>). Click Configure.

**Note:** For information on setting up redirect URI, refer <https://docs.microsoft.com/en-us/azure/active-directory/develop/reply-url>

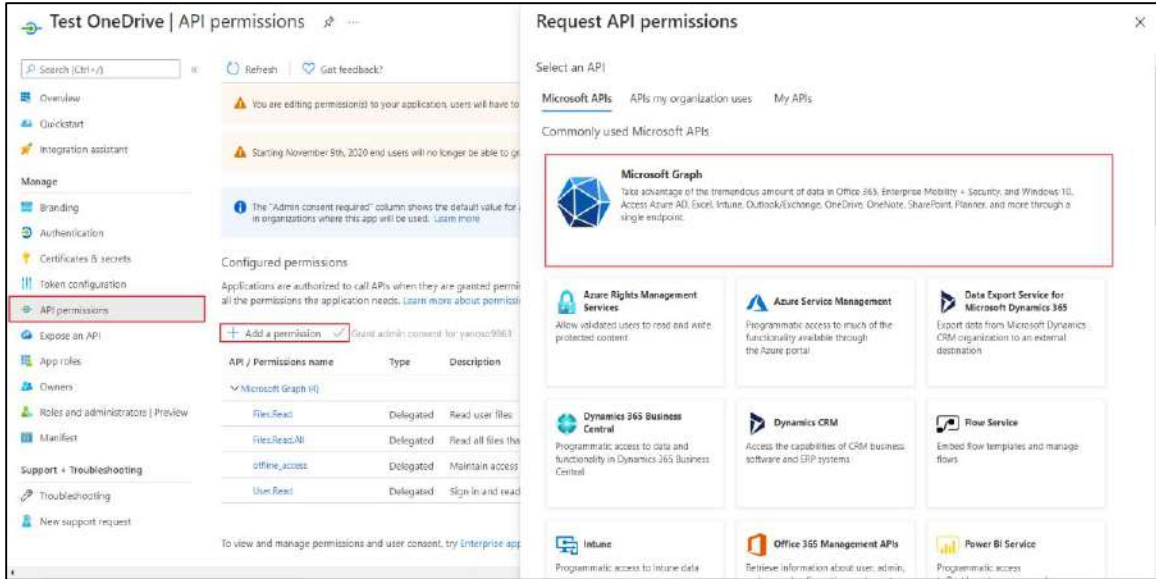

- In the application page, copy Client ID, and then click API permissions.

**Note:** Client ID is mandatory for personal account.

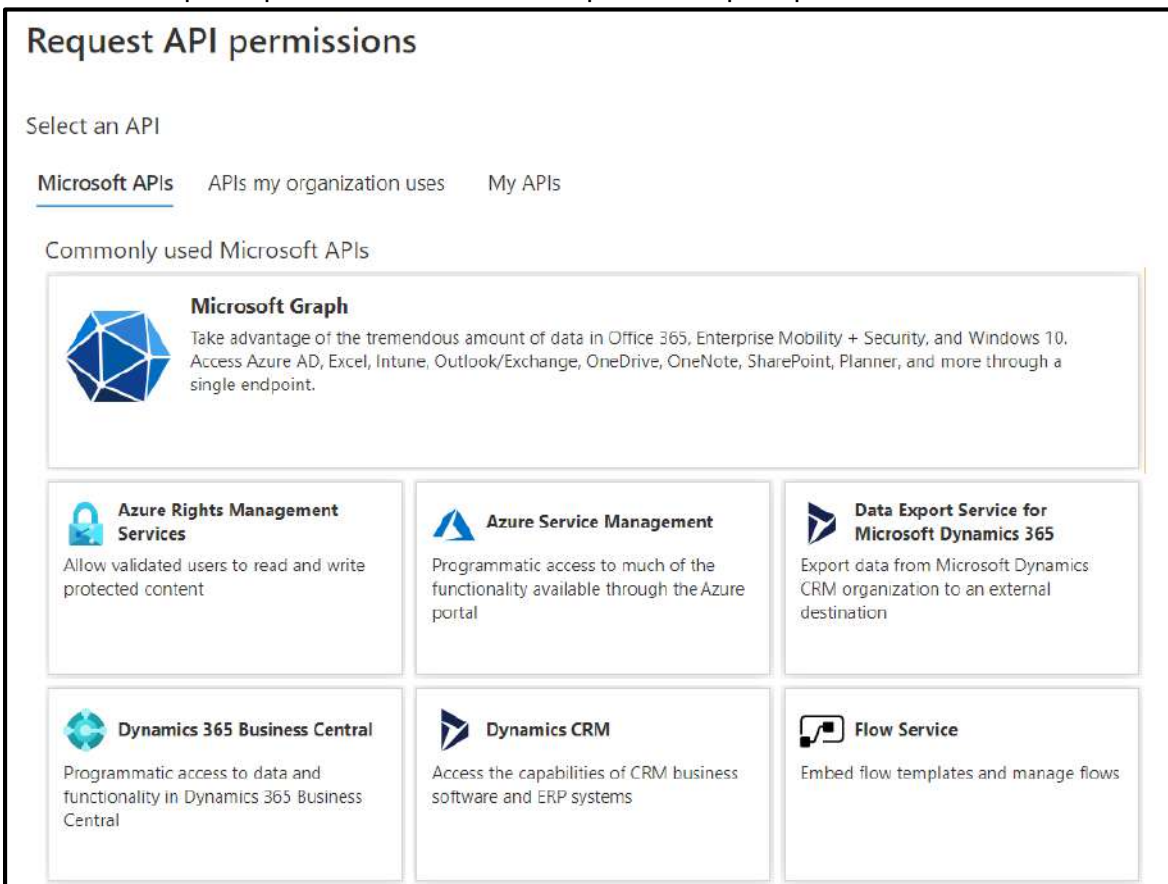

- Click Add a Permission, and then select Microsoft Graph.

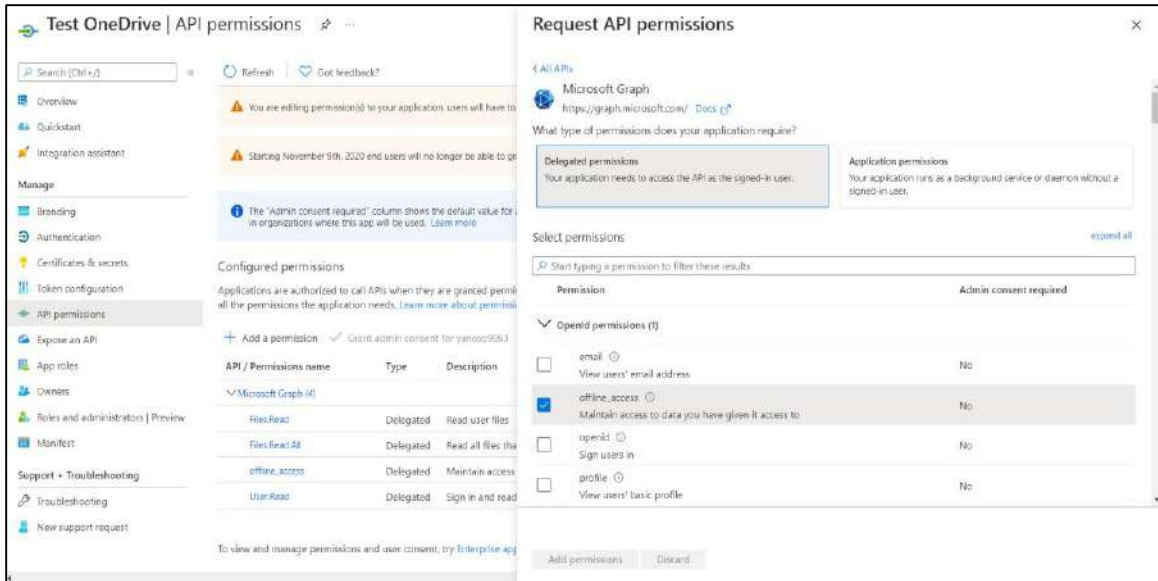

9. Provide all required permissions. See the respective step for permission details.

**Note:** Delegated **offline\_access** permission is mandatory to generate the refresh token.

**Permission type**

Delegated (work or school account)

**Mandatory Permission**

offline\_access

For more information, refer:

<https://docs.microsoft.com/en-us/azure/active-directory/develop/quickstart-register-app#register-an-application>

For more information about redirect URI setup, refer documentation.

<https://docs.microsoft.com/en-us/azure/active-directory/develop/reply-url>

## 12.2 Generate Refresh Token for OneDrive

(The following steps are part of Microsoft Graph Code Flow).

### Step 1. Get an authorization code

To start the sign-in process with the code flow, use a web browser.

1. Load the URL request.

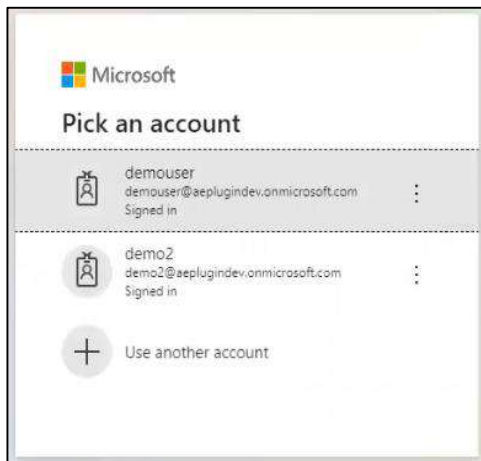

**GET**

https://login.microsoftonline.com/common/oauth2/v2.0/authorize?client\_id={client\_id}&scope={scope} &response\_type=code

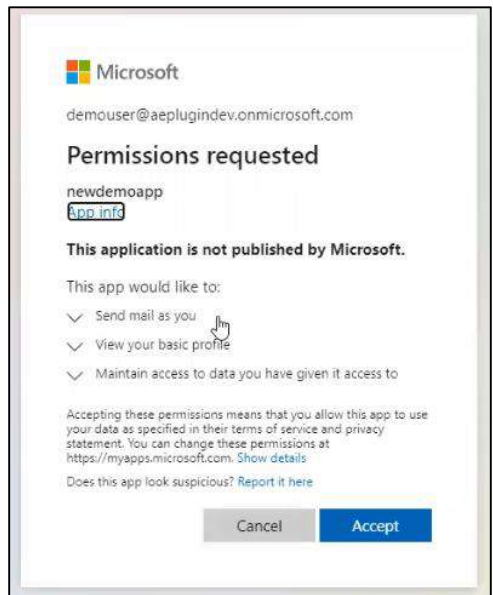

**Example:**

https://login.microsoftonline.com/common/oauth2/v2.0/authorize?client\_id=bc096046-323f-4f98-91e6-fc1f28cank&scope=Files.Read Files.Read.All offline\_access User.Read &response\_type=code

- a) After running in the browser the below login screen will appear, log in with the user who has created the app.

- b) After login below screen will appear, on below screen click on Accept button.

- c) After clicking on accept button you will redirect to URI provided during app creation, once you are redirected, you would get the code in address bar as shown in below screenshot.

2. Redeem the code for access tokens and refresh token  
After you have received the code value, you can redeem this code for a set of tokens that allow you to authenticate with the OneDrive API. To redeem the code, make the following request:

Below are the details

#### POST

<https://login.microsoftonline.com/common/oauth2/v2.0/token>

#### Headers:

Content-Type: application/x-www-form-urlencoded

#### Body: x-www-form-urlencoded (key value pair)

client\_id={client\_id}

code={code}

grant\_type=authorization\_code

For more information, refer:

<https://docs.microsoft.com/en-us/onedrive/developer/rest-api/getting-started/graph-oauth?view=odsp-graph-online#code-flow>

#### Example:

Postman Request:

Postman Response:

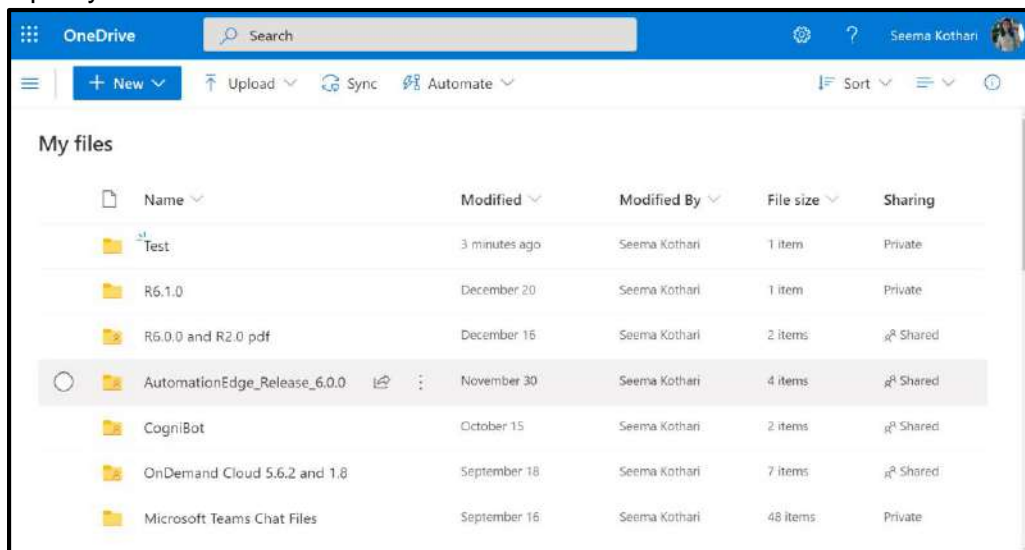

## 13 Appendix 13: OneDrive Folder/File Path

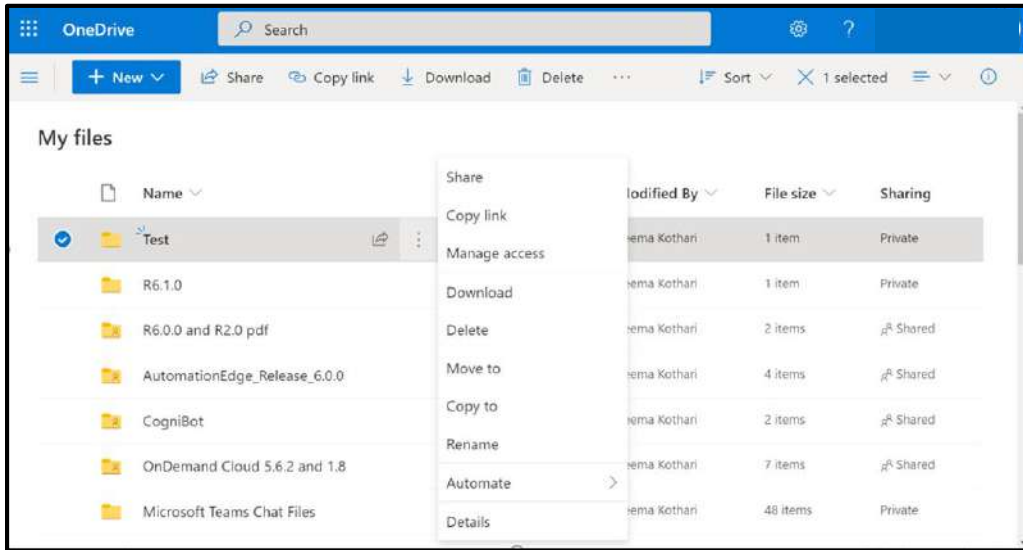

### 13.1 Get Folder Path

Following are the steps to get Folder Path,

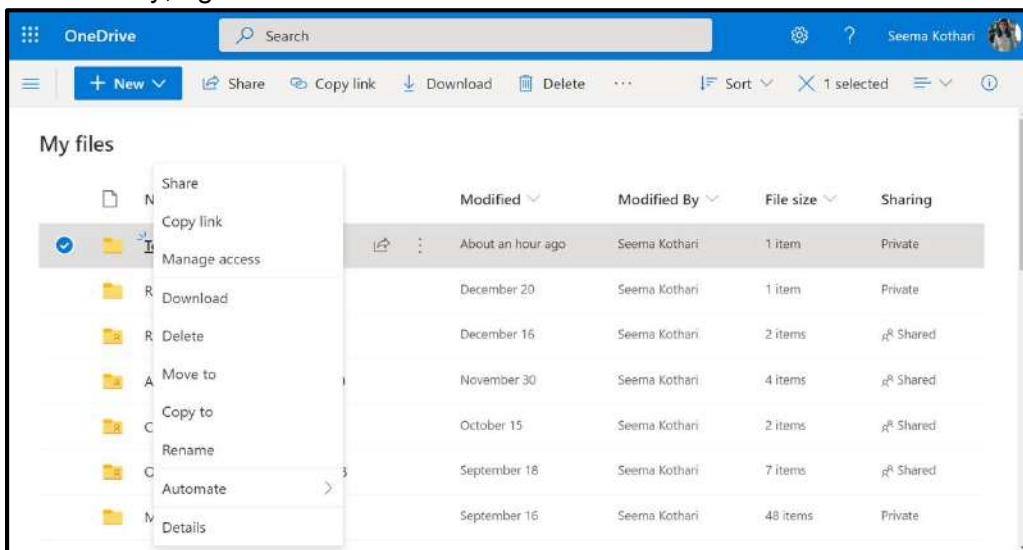

1. Open your One Drive.

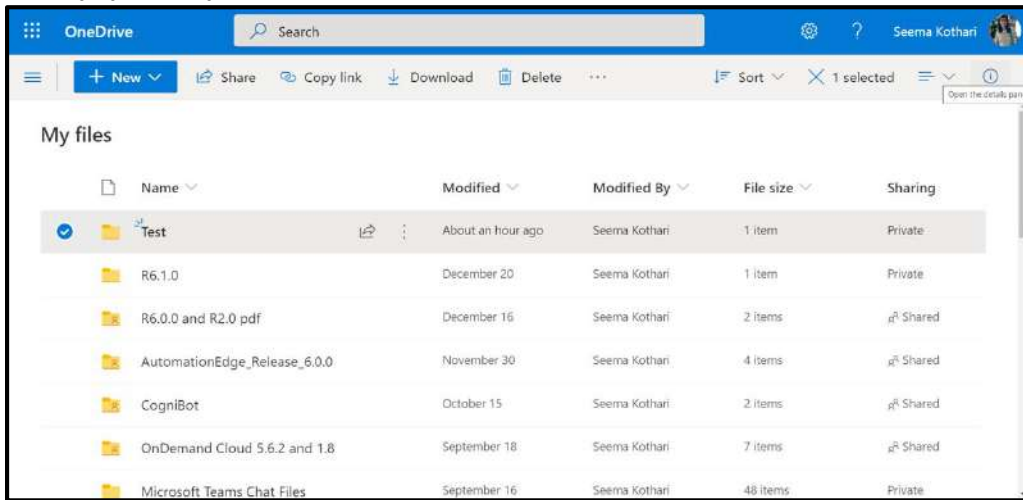

- Click the Show actions icon (  ) and select Details in the pop-up menu.

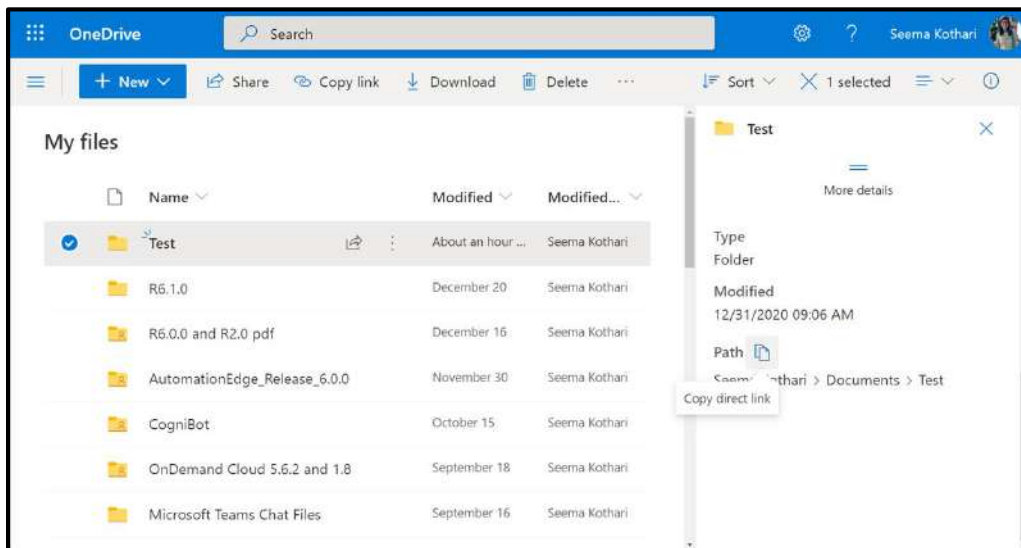

- Alternatively, right click on the folder and select Details.

4. Thirdly, you may click on the 'Open the details pane'.

5. In the details pane navigate to the bottom and click the 'Copy direct link' icon for the Path.

6. In this case the folder path appears as follows,

[https://automationedge1-my.sharepoint.com/personal/seema\\_kothari\\_automationedge\\_com/Documents/Test](https://automationedge1-my.sharepoint.com/personal/seema_kothari_automationedge_com/Documents/Test)

7. In the OneDrive plugin steps

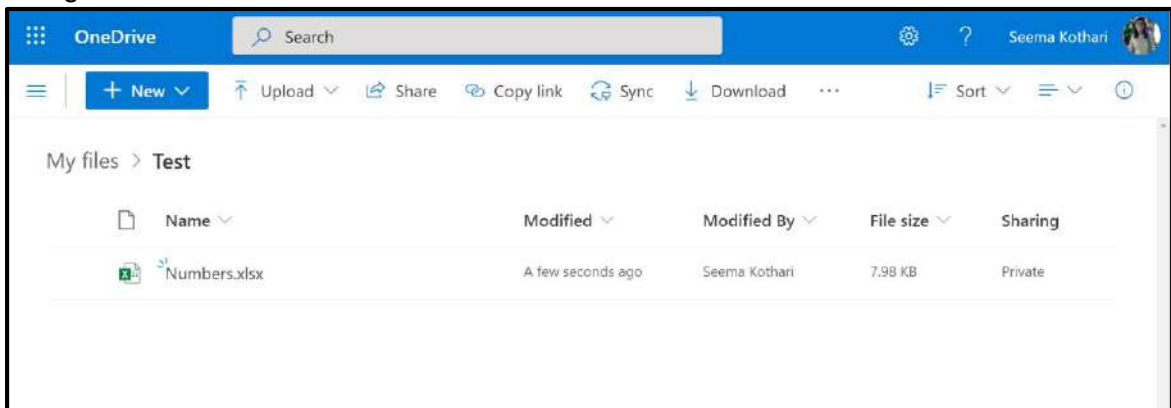

- Refer the root folder as: Documents/

- Refer a folder in the root as: Documents/<a sub-folder under root>
- Refer a sub folder in the root as:
  - Documents/<a sub-folder1 under root>/<a sub-folder2>
  - or simply  
/<a sub-folder1 under root>/<a sub-folder2>

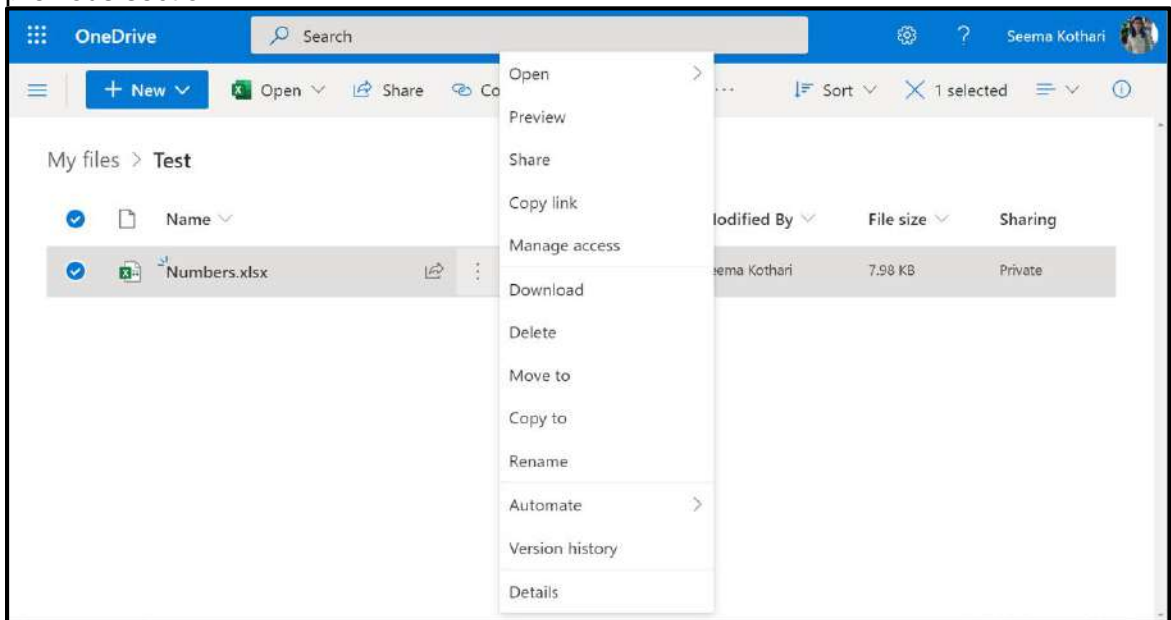

## 13.2 Get File Path

Following are the steps to get File path,

1. Navigate to the desired file on OneDrive.

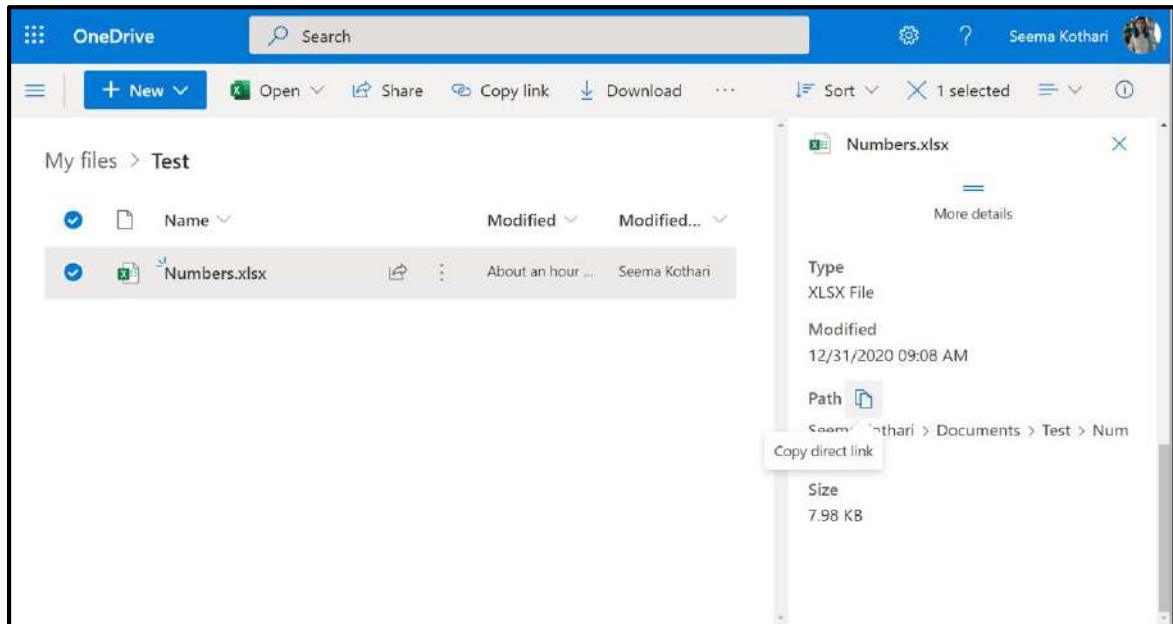

2. Follow one of the methods to go to the details pane as described for folders in the previous section.

### 3. Copy the Path URL.

### 4. Following is a sample File path URI.

[https://automationedge1-my.sharepoint.com/personal/seema\\_kothari\\_automationedge\\_com/Documents/Test/Numbers.xlsx](https://automationedge1-my.sharepoint.com/personal/seema_kothari_automationedge_com/Documents/Test/Numbers.xlsx)

### 5. In the OneDrive plugin steps

- Refer the root folder as: Documents/
- Refer a file in the root as: Documents/<a filename under root>
- Refer a sub folder in a sub-folder as:
  - Documents/<a sub-folder1 under root>/<a filename>
  - or simply
  - /<a sub-folder1 under root>/<a filename>

## 14 Appendix 14: Managed Engine SDP- Generate Auth Token/Refresh Token

### 14.1 On-Premise

In the on-premise deployment of ManageEngine SDP, you need to provide the Auth Token to access the APIs. It is used for authentication. Every user with login permission can generate an Auth Token with/without an expiry date.

### 14.1.1 Steps to generate the Auth Token

Perform these steps to generate Auth Token.

1. Go to 'Admin -> Technicians'.
2. To generate an API key for an existing technician, click the Edit icon beside that Technician and to generate the API key for a new technician, click the Add New Technician link, enter the Technician details and provide login permission.
3. Click Generate link under the API key details block.
4. Select a time frame for the key to expire using the Calendar icon, or simply retain the same key perpetually.
5. If a key is already generated for the Technician, a Re-generate link appears.
6. A time frame for the key is selected, within which the key expires.

Use this Auth Token in the ManageEngine SDP plugin steps connection parameters.

## 14.2 Cloud

ManageEngine ServiceDesk Plus Cloud APIs use selected scopes, which control the type of resource that the client application can access. Tokens are usually created with various scopes to ensure improved security. Scopes contain three parameters — service name, scope name, and operation type. The format to define scope is

**“Scope = SDPOnDemand.scope\_name.operation\_type”**

Example: scope=SDPOnDemand.problems.ALL

Here, “SDPOnDemand” is the service name, “problems” is the scope name, and “ALL” is the operation type.

You can find the list of available scopes with their description on this link

<https://www.manageengine.com/products/service-desk/sdpod-v3-api/SDPOD-V3-API.html#scopes>

**Note:** One or more scopes can also be mentioned as comma-separated in scope.

### 14.2.1 Steps to generate the Refresh Token

Generate Client ID, Client Secret and Refresh token for connection to Manage Engine SDP.

1. Register your application with ManageEngine ServiceDesk Plus Cloud API.
2. To register, go to appropriate Zoho Developer Console URL depending on Data Centre selected when creating the ManageEngine SDP account.  
(<https://www.manageengine.com/products/service-desk/sdpod-v3-api/getting-started/data-centers.html>).
3. Choose Self Client from the list of client types, and click Create Now.
4. Click OK in the pop-up to enable a self-client for your account.
5. Now, your client ID and client secret are displayed under the Client Secret tab.

6. Click the Generate Code tab and enter the required scope separated by commas. Refer to our list of Scopes, for more details. The system throws an 'Enter a valid scope' error when you enter one or more incorrect scopes.
7. Select the Time Duration for which the grant token is valid.  
**Note:** After the time duration, the grant token expires.
8. Enter a description and click Generate.
9. The generated code for the specified scope is displayed. Copy the grant token.
10. Make a POST request with the appropriate Accounts Server URL depending on Data Centre of the ManageEngine SDP instance.  
(<https://www.manageengine.com/products/service-desk/sdpod-v3-api/getting-started/data-centers.html>).

For example:

<https://accounts.zoho.com/oauth/v2/token>

<https://accounts.zoho.in/oauth/v2/token>

<https://accounts.zoho.in.au>

<https://accounts.zoho.eu>

<https://accounts.zoho.in.cn>

### Request Parameters

| Parameter     | Description                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| code          | Enter the Grant Token / Authorization Code generated from the previous step.                                                                 |
| grant_type    | Enter the value as "authorization_code".                                                                                                     |
| client_id     | Specify client-id obtained from the connected app.                                                                                           |
| client_secret | Specify client-secret obtained from the connected app.                                                                                       |
| redirect_uri  | Specify the Callback URL that you registered during the app registration. E.g. <a href="https://www.postman.com">https://www.postman.com</a> |

If the request is successful, you will receive the following output:

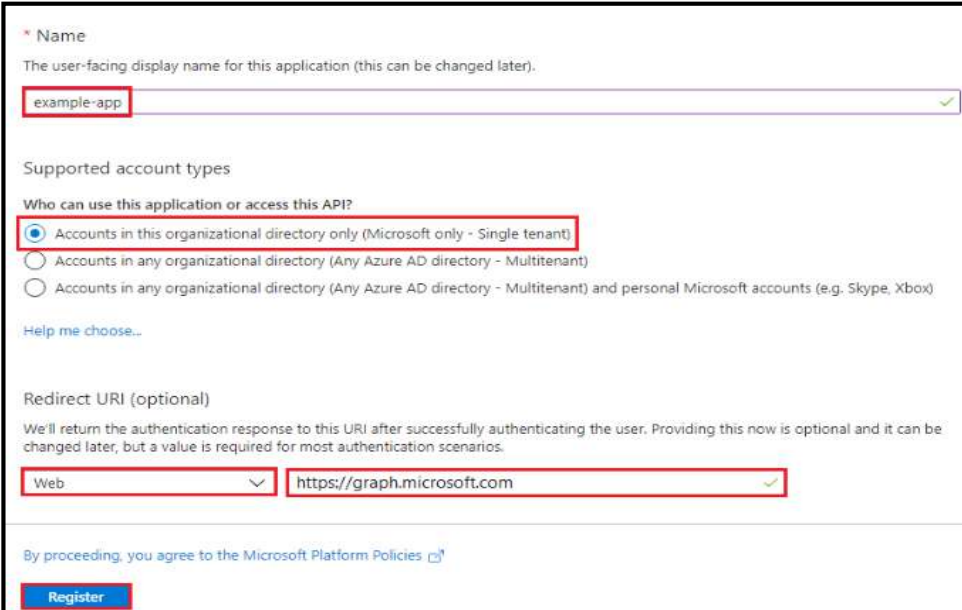

```
{ "access_token":
"1000.2370ff1fd75e968ae780cd8d14841e82.03518d2d1dab9c6c4cf74ae82b89defa",
"refresh_token":
"1000.2afabf2f5a396325e88f715c6de34d12.edce6130ca3832a14e5f80d005a5324d",
"token_type": "Bearer", "expires_in": 3600 }
```

Use this Refresh Token along with the Client ID & Client Secret (that are generated in the registered client) in the ManageEngine SDP plugin steps to get them started.

## 15 Appendix 15: Office 365 App Registration for Grant Type – Password Grant

### 15.1 Register App

1. Sign in to your Azure Account through the [Azure portal](#).
2. Select the **Azure Active Directory**.
3. Select **App registrations**.
4. Select an App created for AutomationEdge Plugin steps or alternatively, Select **New registration**.
5. Name the application. Select a supported account type, which determines who can use the application.
6. Additionally, for email related steps- Download Email Attachments, Email Message Input and Send Email, under **Redirect URI**, select **Web** for the type of application you want to create. For example, <https://automationedge.com> as seen in the screenshot below. Select **Register**.

\* Name  
The user-facing display name for this application (this can be changed later).  
example-app ✓

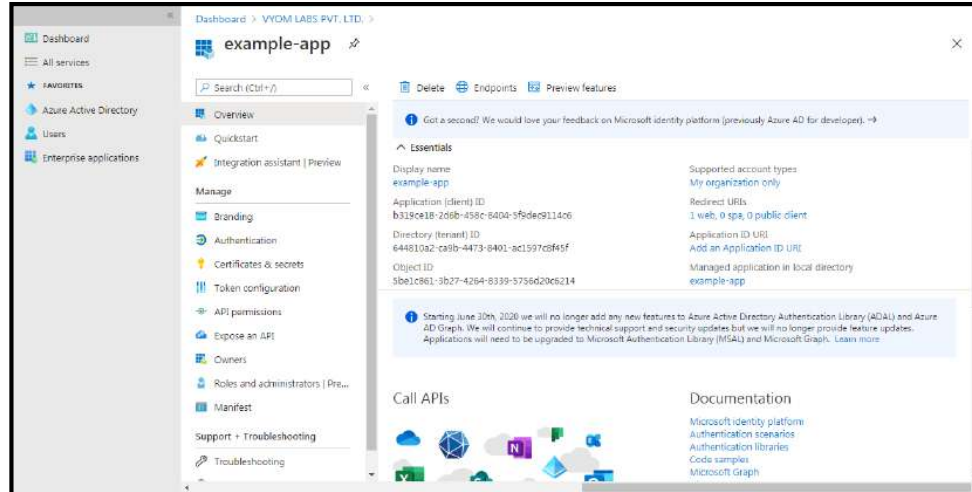

Supported account types  
Who can use this application or access this API?  
 Accounts in this organizational directory only (Microsoft only - Single tenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant) and personal Microsoft accounts (e.g. Skype, Xbox)  
[Help me choose..](#)

Redirect URI (optional)  
We'll return the authentication response to this URI after successfully authenticating the user. Providing this now is optional and it can be changed later, but a value is required for most authentication scenarios.  
Web ✓  ✓

By proceeding, you agree to the [Microsoft Platform Policies](#) 

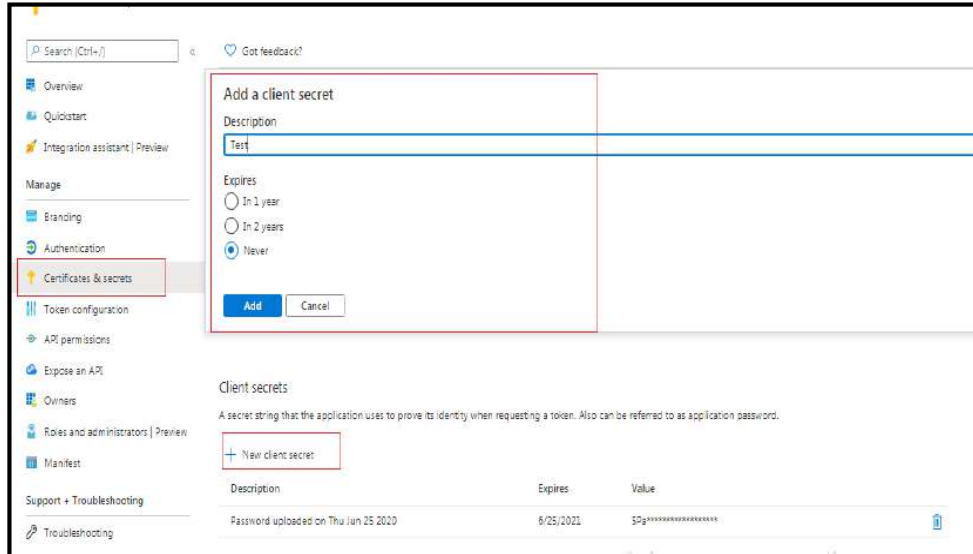

**Register**

Upon registration fetch Tenant ID and Client ID for the App as seen below.

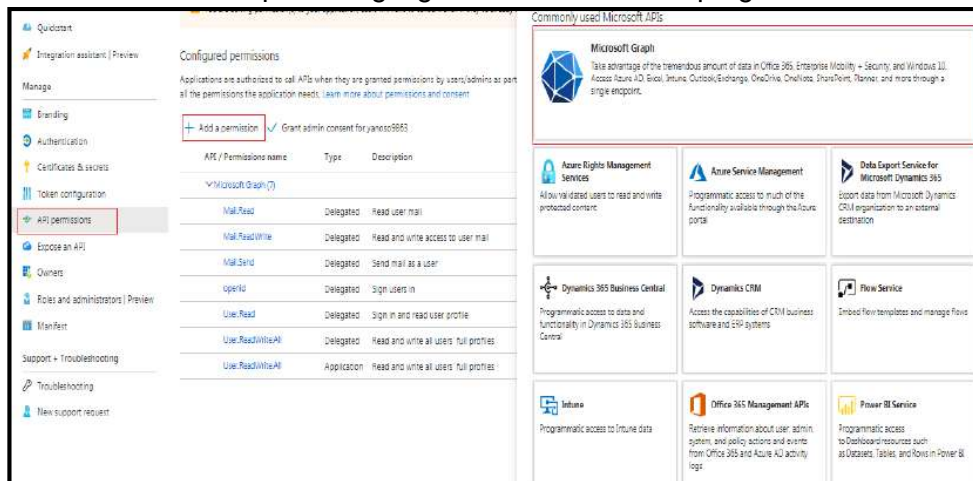

## 15.2 Creating Client Secret

1. Click on Certificates and secrets
2. Click on New client secret
3. Enter Description
4. Select one of Expires Radio Button

## 15.3 Provide API Permission

1. Click on API Permission.
2. Click on Add Permission.
3. Click 'Microsoft Graph' as highlighted below on the top right corner.

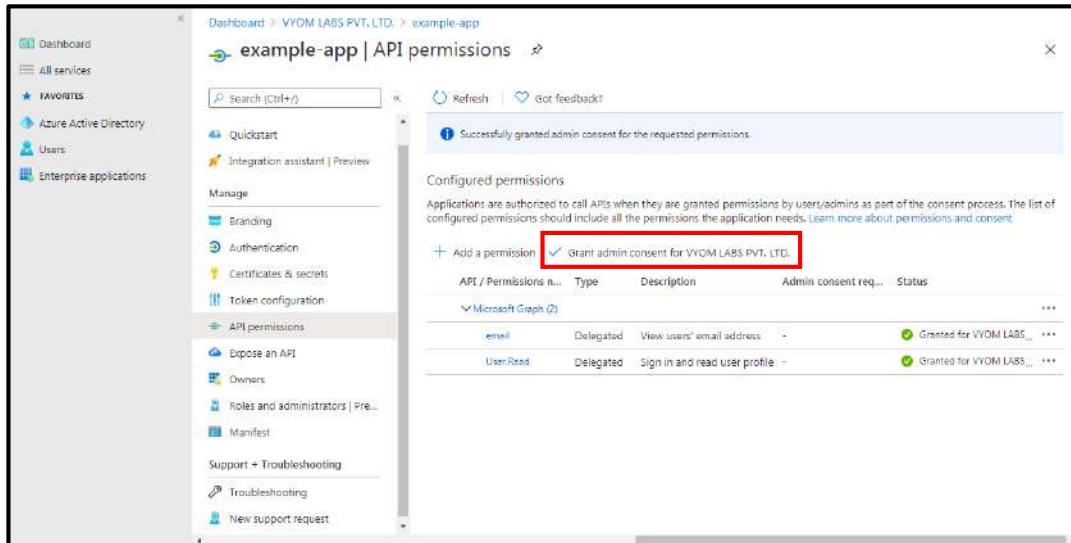

4. Click 'Delegated Permissions' or 'Application permissions' as required and as mentioned in the Plugin Step documentation.
5. Provide all required permissions for the Plugin steps to execute. The permissions required are mentioned in the Plugin steps.

## 15.4 Consent for Permission to App

### 15.4.1 Grant admin consent

You need to Grant Admin consent to the app to access all accounts data, for all Plugin steps except email related steps as mentioned in the following section:

Users can request Azure AD administrator to grant admin consent. The following screenshot shows an Administrator view with option to Grant Admin consent.

### 15.4.2 Build a URL and Run in Browser to allow permissions to the APP

The steps in this section are required for Office 365 Plugin steps - Download Email Attachments, Email Message Input and Send Email.

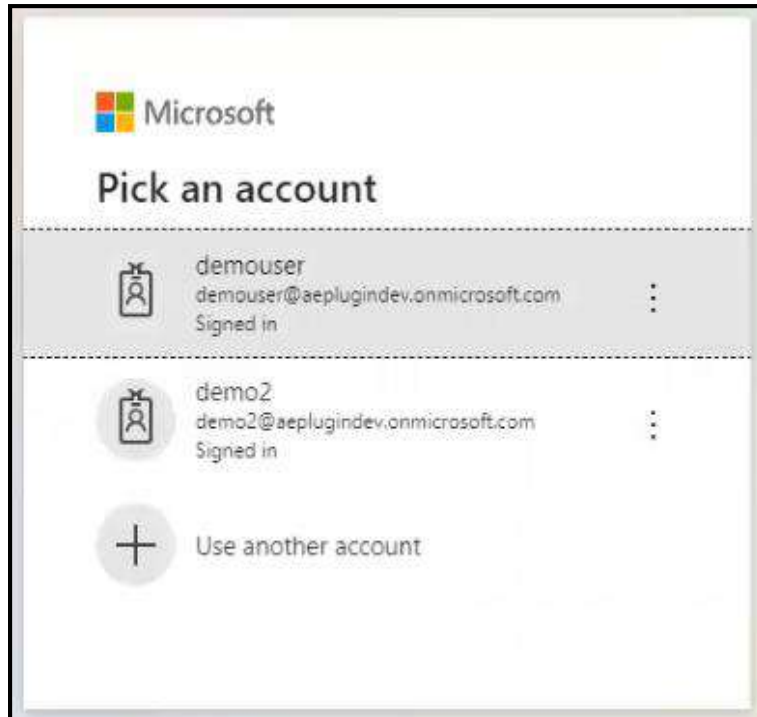

To allow your app to use the data provided in the permissions under section [Provide API Permission](#) perform the following steps.

- i. Build a URL in the following format and run in browser.  
[https://login.microsoftonline.com/Tenant\\_id/oauth2/v2.0/authorize?client\\_id=alue&scope=Permissions &response\\_type=code](https://login.microsoftonline.com/Tenant_id/oauth2/v2.0/authorize?client_id=alue&scope=Permissions &response_type=code).

Example:

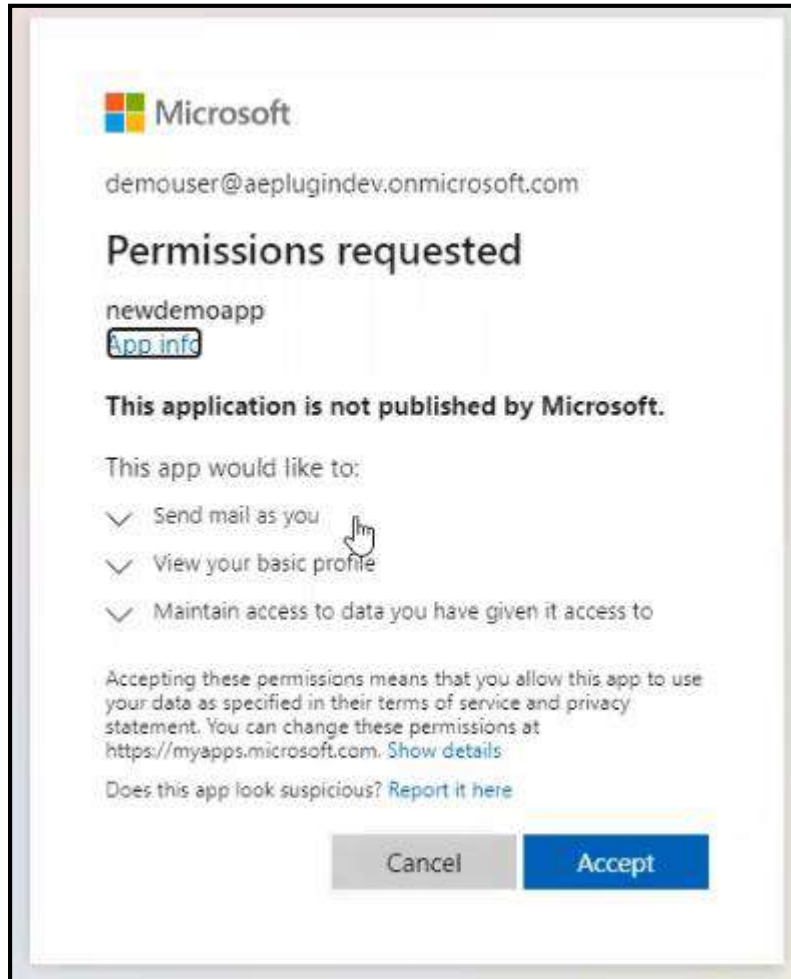

[https://login.microsoftonline.com/2f906216-6aaa-4ee5-8c13-5bbb3af06089/oauth2/v2.0/authorize?client\\_id=e6080cc9-dccc-4e8b-a22e-93174e01459b&scope=Mail.Read Mail.ReadWrite Mail.Send openid User.Read &response\\_type=code](https://login.microsoftonline.com/2f906216-6aaa-4ee5-8c13-5bbb3af06089/oauth2/v2.0/authorize?client_id=e6080cc9-dccc-4e8b-a22e-93174e01459b&scope=Mail.Read Mail.ReadWrite Mail.Send openid User.Read &response_type=code)

- ii. After running the URL in the browser a login screen appears as below. Login with the user who created the App.

- iii. After login Permissions Requested screen appears. Click on Accept Button.

## 16 Appendix: O365 App Registration, Authentication and Permissions in Azure AD

### 16.1 Register App

8. Sign in to [Azure portal](#) with the email address having permission to perform the action to be automated. The permission details are mentioned under the specific step documentation.
9. For the automation of email handling actions, Sign in to the Azure portal with the email address that is going to be used in the step.
10. Select the **Azure Active Directory**.
11. Select **App registrations**.

12. Select an App created for AutomationEdge Plugin steps or alternatively, Select **New registration**.
13. Name the application. Select a supported account type, which determines who can use the application.
14. Additionally, for email related steps- Download Email Attachments, Email Message Input and Send Email, under **Redirect URI**, select **Web** for the type of application you want to create. For example, <https://automationedge.com> as seen in the screenshot below. Select **Register**.

**\* Name**  
The user-facing display name for this application (this can be changed later).  
example-app ✓

**Supported account types**  
Who can use this application or access this API?  
 Accounts in this organizational directory only (Microsoft only - Single tenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant) and personal Microsoft accounts (e.g. Skype, Xbox)  
[Help me choose..](#)

**Redirect URI (optional)**  
We'll return the authentication response to this URI after successfully authenticating the user. Providing this now is optional and it can be changed later, but a value is required for most authentication scenarios.

Starting June 30th, 2020 we will no longer add any new features to Azure Active Directory Authentication Library (ADAL) and Azure AD Graph. We will continue to provide technical support and security updates but we will no longer provide feature updates. Applications will need to be upgraded to Microsoft Authentication Library (MSAL) and Microsoft Graph. [Learn more.](#)

Supported account types : [My organization only](#)

10. Check the checkbox provided in below screen shot and click on save.

### Implicit grant and hybrid flows

Request a token directly from the authorization endpoint. If the application has a single-page architecture (SPA) and doesn't use the authorization code flow, or if it invokes a web API via JavaScript, select both access tokens and ID tokens. For ASP.NET Core web apps and other web apps that use hybrid authentication, select only ID tokens. [Learn more about tokens.](#)

Select the tokens you would like to be issued by the authorization endpoint:

- Access tokens (used for implicit flows)
- ID tokens (used for implicit and hybrid flows)

## 18.2 Provide API Permission

1. Click on **API Permission**.
2. Click on **Add Permission**.
3. Click on **Microsoft Graph**.
4. Provide all required permissions.

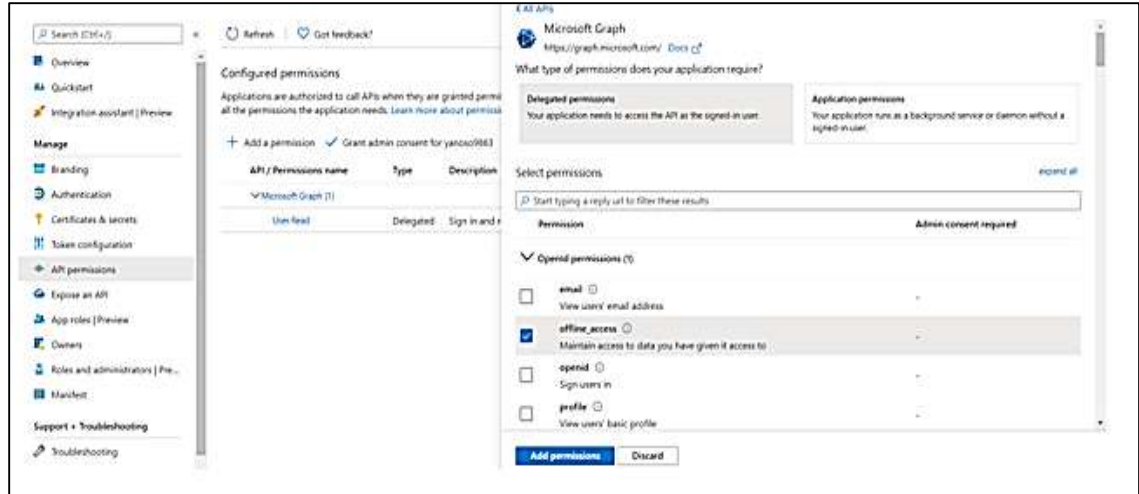

The screenshot shows the 'API permissions' configuration page in the Azure portal. The left sidebar has 'API permissions' selected. The main content area is titled 'Configured permissions' and shows a table of permissions for 'Microsoft Graph (7)'. A red box highlights the '+ Add a permission' button. The table lists the following permissions:

| API / Permissions name | Type        | Description                             |
|------------------------|-------------|-----------------------------------------|
| Mail.Read              | Delegated   | Read user mail                          |
| Mail.ReadWrite         | Delegated   | Read and write access to user mail      |
| Mail.Send              | Delegated   | Send mail as a user                     |
| openid                 | Delegated   | Sign users in                           |
| User.Read              | Delegated   | Sign in and read user profile           |
| User.ReadWrite.All     | Delegated   | Read and write all users' full profiles |
| User.ReadWrite.All     | Application | Read and write all users' full profiles |

To the right, the 'Commonly used Microsoft APIs' section lists several services with their descriptions:

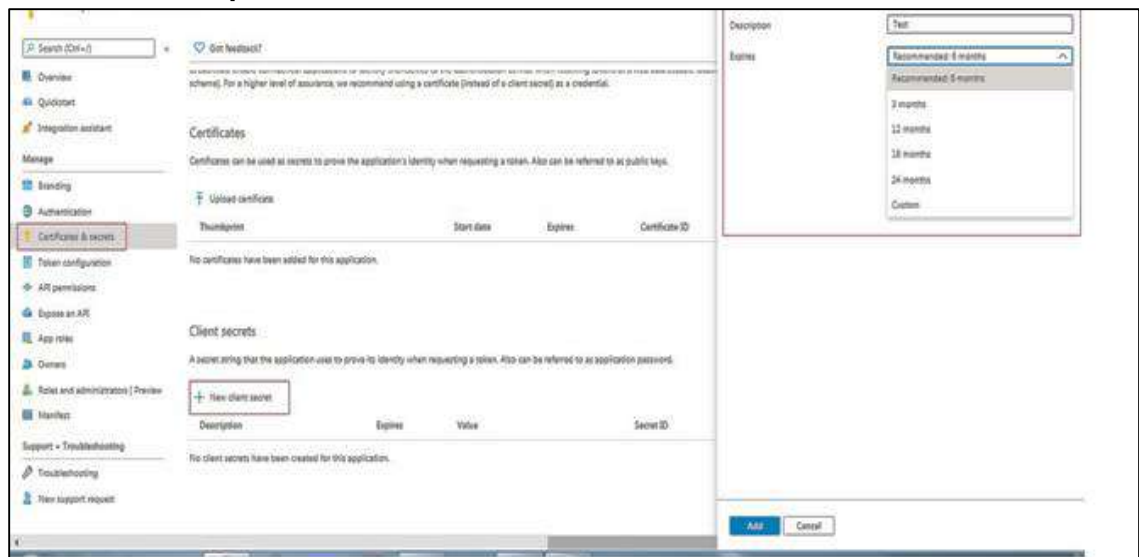

- Microsoft Graph:** Take advantage of the tremendous amount of data in Office 365, Enterprise Mobility + Security, and Windows 10. Access Azure AD, Excel, Intune, Outlook/Exchange, OneDrive, OneNote, SharePoint, Planner, and more through a single endpoint.
- Azure Rights Management Services:** Allow validated users to read and write protected content.
- Azure Service Management:** Programmatic access to much of the functionality available through the Azure portal.
- Data Export Service for Microsoft Dynamics 365:** Export data from Microsoft Dynamics CRM organization to an external destination.
- Dynamics 365 Business Central:** Programmatic access to data and functionality in Dynamics 365 Business Central.
- Dynamics CRM:** Access the capabilities of CRM business software and ERP systems.
- Flow Service:** Embed flow templates and manage flows.
- Intune:** Programmatic access to Intune data.
- Office 365 Management APIs:** Retrieve information about user, admin, system, and policy actions and events from Office 365 and Azure AD activity logs.
- Power BI Service:** Programmatic access to Dashboard resources such as Datasets, Tables, and Rows in Power BI.

**Note:** Delegated **Offline\_access** permission is mandatory to generate the refresh token.

### 18.3 Creating Client Secret

1. Click on **Certificates and secrets**.
2. Click on **New client secret**.
3. Enter **Description**.
4. Select the **Expires** value.

5. Copy and save the value with you as it visible only for one time.

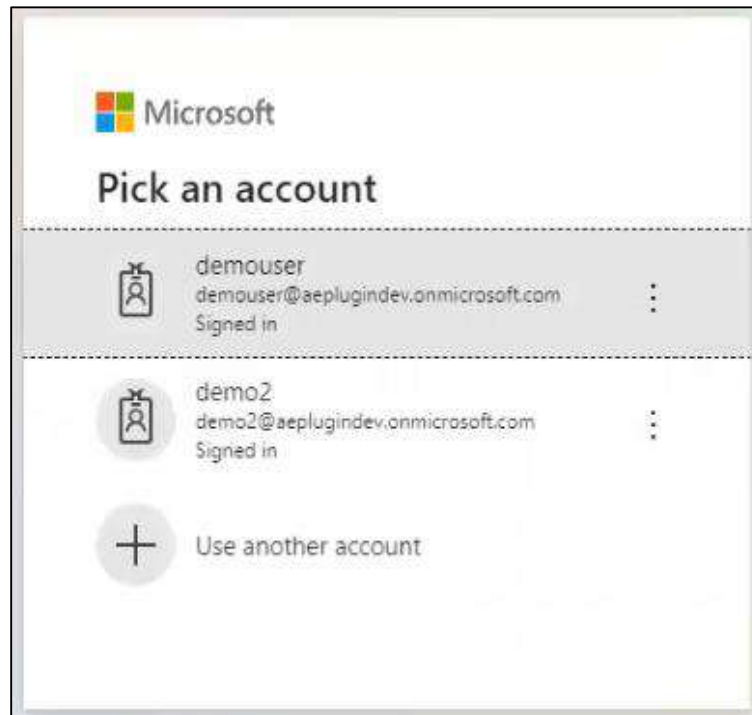

## 18.4 How to generate Refresh Token URL and Run in Browser

1. Create Below URL and run in browser.  
[https://login.microsoftonline.com/Tenant\\_id/oauth2/v2.0/authorize?client\\_id=valu e&scope=Permissions &response\\_type=code](https://login.microsoftonline.com/Tenant_id/oauth2/v2.0/authorize?client_id=valu e&scope=Permissions &response_type=code).

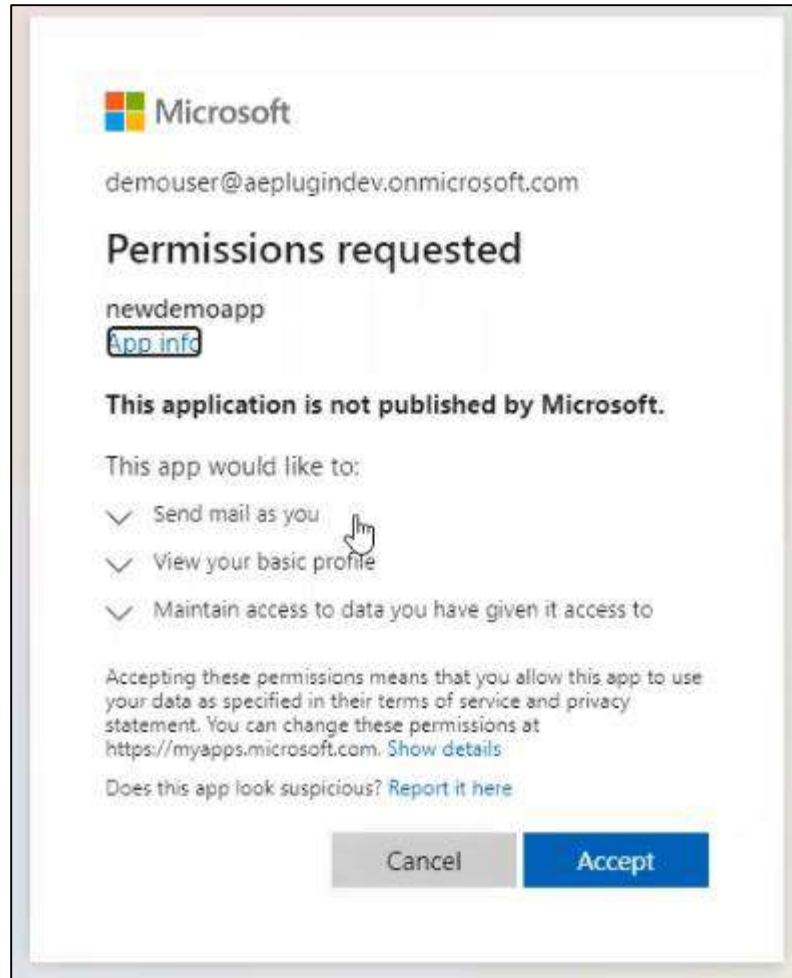

Example:

[https://login.microsoftonline.com/2f906216-6aaa-4ee5-8c13-5bbb3af06089/oauth2/v2.0/authorize?client\\_id=e6080cc9-dccc-4e8b-a22e-93174e01459b&scope=Mail.Read](https://login.microsoftonline.com/2f906216-6aaa-4ee5-8c13-5bbb3af06089/oauth2/v2.0/authorize?client_id=e6080cc9-dccc-4e8b-a22e-93174e01459b&scope=Mail.Read) Mail.ReadWrite Mail.Send openid User.Read offline\_access &response\_type=code

2. After running in the browser the below login screen will appear, log in with the user who has created the app.

3. After login below screen will appear, on below screen click on Accept Button.

4. After clicking on accept button you will redirect to URI provided during app creation, once you are redirected you will get the code in address bar as shown in below screen shot.

5. In below image highlighted is the sample code to be fetched from URL.

```

- Once you get the code you need to create a POST request in postman to generate the refresh token.  
Below are the details

**POST**

**URL:** <https://login.microsoftonline.com/{Tenant id}/oauth2/v2.0/token>

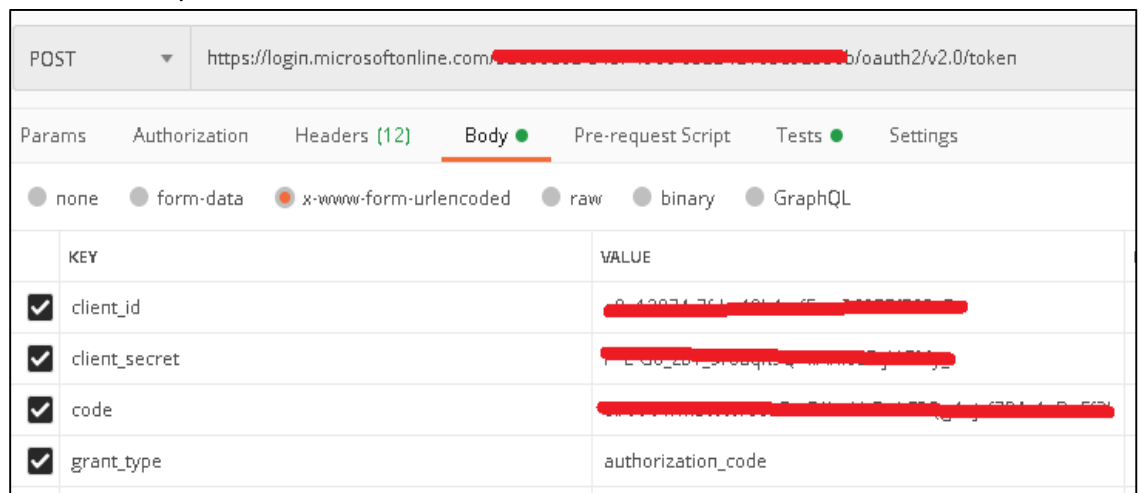

**Headers:**

Content-Type: application/x-www-form-urlencoded

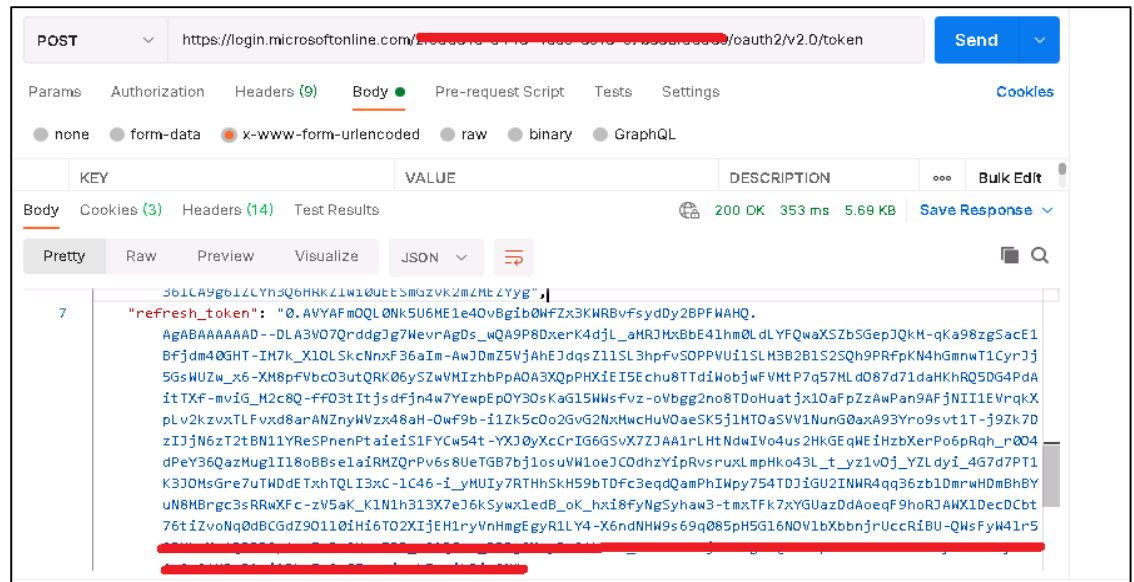

**Body:** x-www-form-urlencoded(key value pair)

```
client_id={client_id}
client_secret={ client_secret }
code={code}
grant_type=authorization_code
```

**Postman Request:**

Postman Response:

## 19 Appendix 17: SharePoint Online: App Registration & Refresh Token Generation

### 19.1 Register App

Following are the steps to register App,

11. Sign in to your Azure Account through the [Azure portal](#).
12. Select the **Azure Active Directory**.
13. Select **App Registrations**.
14. Select **New Registration**.
15. Name the application. Select a supported account type, which determines who can use the application.
16. Under **Redirect URI**, select **Public Client/native (mobile & desktop)** for the type of application you want to create and provide valid URL. For example, <https://automationedge.com>.

For more information about redirect URI setup, see <https://docs.microsoft.com/en-us/azure/active-directory/develop/reply-url>

17. Select **Register**.

### Register an application

**\* Name**  
The user-facing display name for this application (this can be changed later).

Test OneDrive

**Supported account types**  
Who can use this application or access this API?

Accounts in this organizational directory only (yanoso9853 only - Single tenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant)  
 Accounts in any organizational directory (Any Azure AD directory - Multitenant) and personal Microsoft accounts (e.g. Skype, Xbox)  
 Personal Microsoft accounts only

Help me choose...

**Redirect URI (optional)**  
We'll return the authentication response to this URI after successfully authenticating the user. Providing this now is optional and it can be changed later, but a value is required for most authentication scenarios.

Public client/native (mobile... | https://automationedge.com

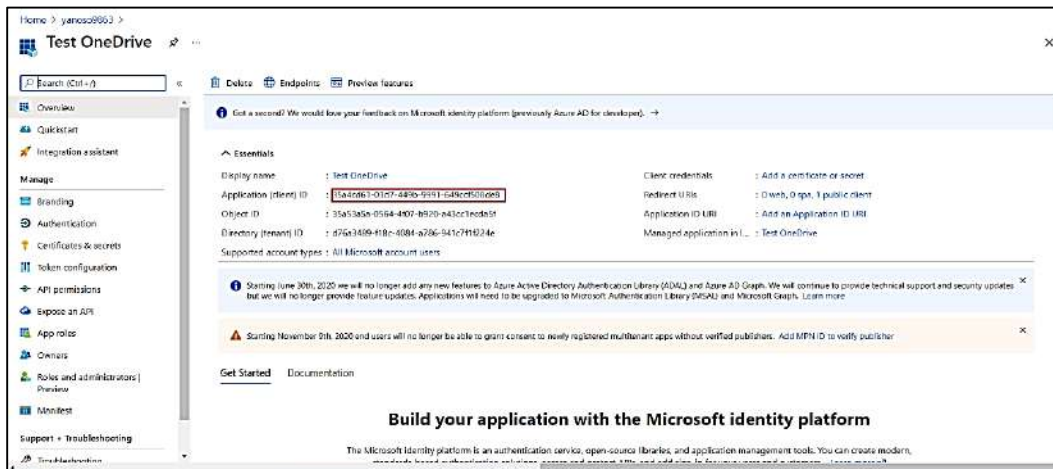

Register an app you're working on here. Integrate gallery apps and other apps from outside your organization by adding from Enterprise applications.

By proceeding, you agree to the Microsoft Platform Policies

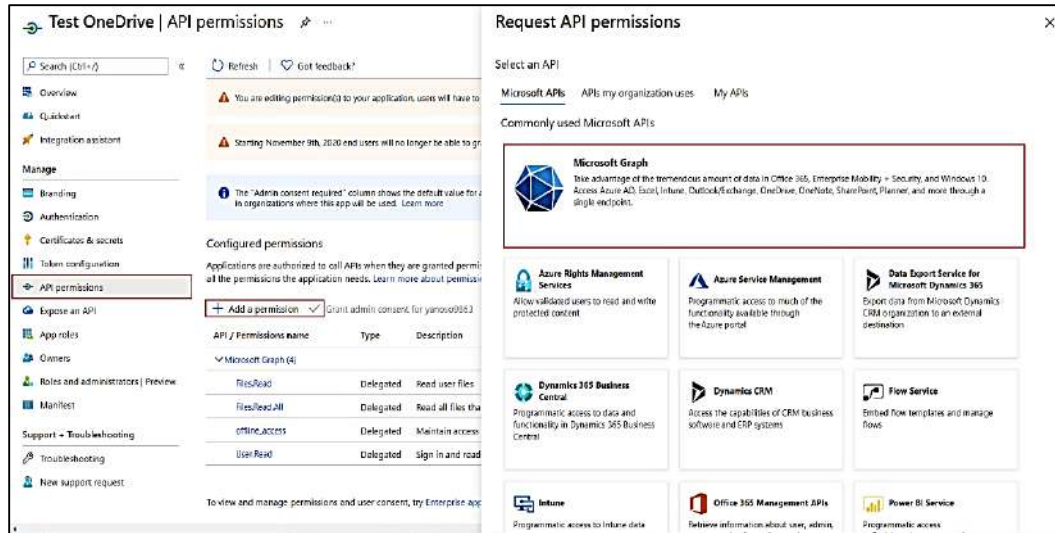

**Register**

## 19.2 Provide API Permission

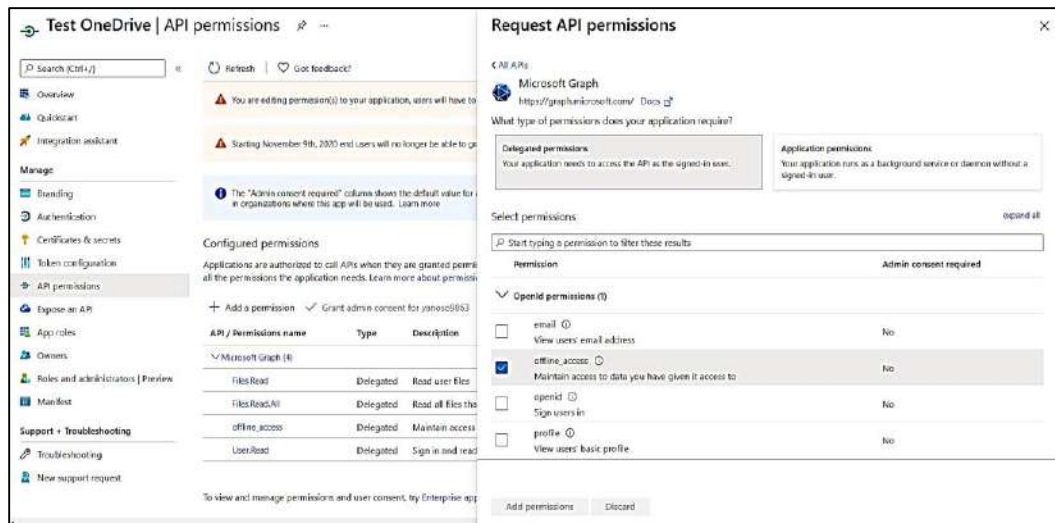

### 1. Copy Client.

2. Click on **API Permission**.
3. Click on **Add Permission**.
4. Click on **Microsoft Graph**.
5. Provide all required permissions.

**NOTE:** Delegated `offline_access` permission is mandatory to generate the refresh token.

For more information, see <https://docs.microsoft.com/en-us/azure/active-directory/develop/quickstart-register-app#register-an-application>

### 19.3 How to generate Refresh Token URL and Run in Browser

1. Get an authorization code
2. To start the sign-in process with the code flow, use a web browser to load the following URL request:

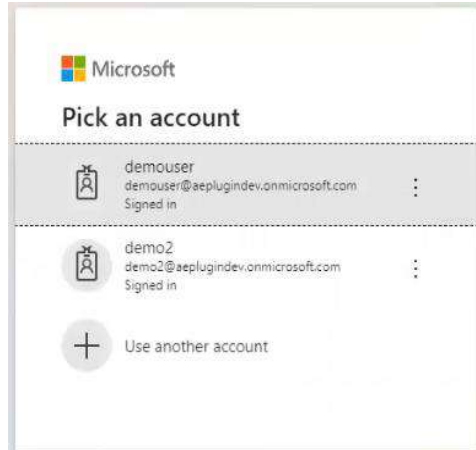

**GET**

```
https://login.microsoftonline.com/common/oauth2/v2.0/authorize?client_id={client_id}&scope={scope} &response_type=code
```

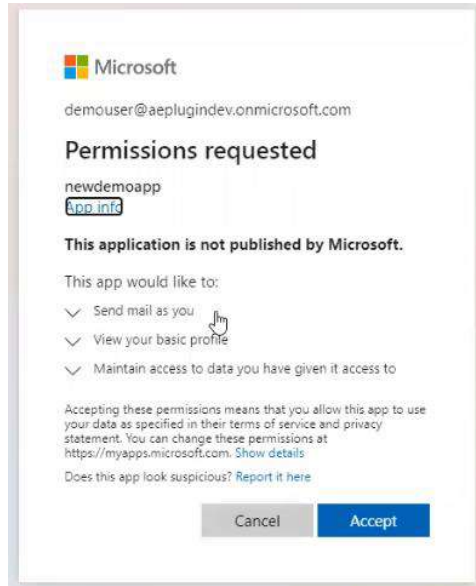

**Example:**

[https://login.microsoftonline.com/common/oauth2/v2.0/authorize?client\\_id=bc096046-323f-4f98-91e6-fc1f28canks&scope=Files.Read Files.Read.All offline\\_access User.Read Sites.Read.All &response\\_type=code](https://login.microsoftonline.com/common/oauth2/v2.0/authorize?client_id=bc096046-323f-4f98-91e6-fc1f28canks&scope=Files.Read Files.Read.All offline_access User.Read Sites.Read.All &response_type=code)

3. After running in the browser the below login screen will appear, log in with the user who has created the app.

4. After login below screen will appear, on below screen click on **Accept** button.

5. After clicking on accept button you will redirect to URI provided during app creation, once you are redirected, you will get the code in address bar as shown in below screen shot.

6. Redeem the code for access tokens and refresh token.

After you have received the code value, you can redeem this code for a set of tokens that allow you to authenticate with the SharePoint API. To redeem the code, make the following request:

**POST**

https://login.microsoftonline.com/common/oauth2/v2.0/token

**Headers:**

Content-Type: application/x-www-form-urlencoded

**Body: x-www-form-urlencoded** (key value pair)

client\_id={client\_id}

code={code}

grant\_type=authorization\_code

For more information, see <https://docs.microsoft.com/en-us/onedrive/developer/rest-api/getting-started/graph-oauth?view=odsp-graph-online#code-flow>

**Example:**

**Postman Request:**

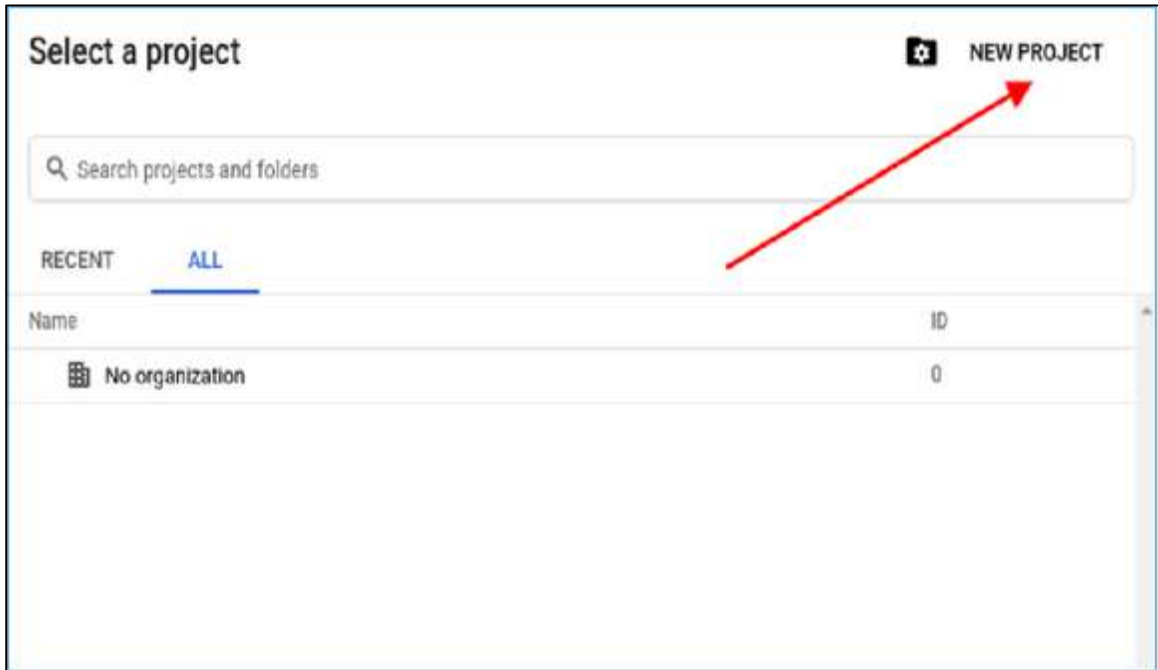

**Postman Response:**

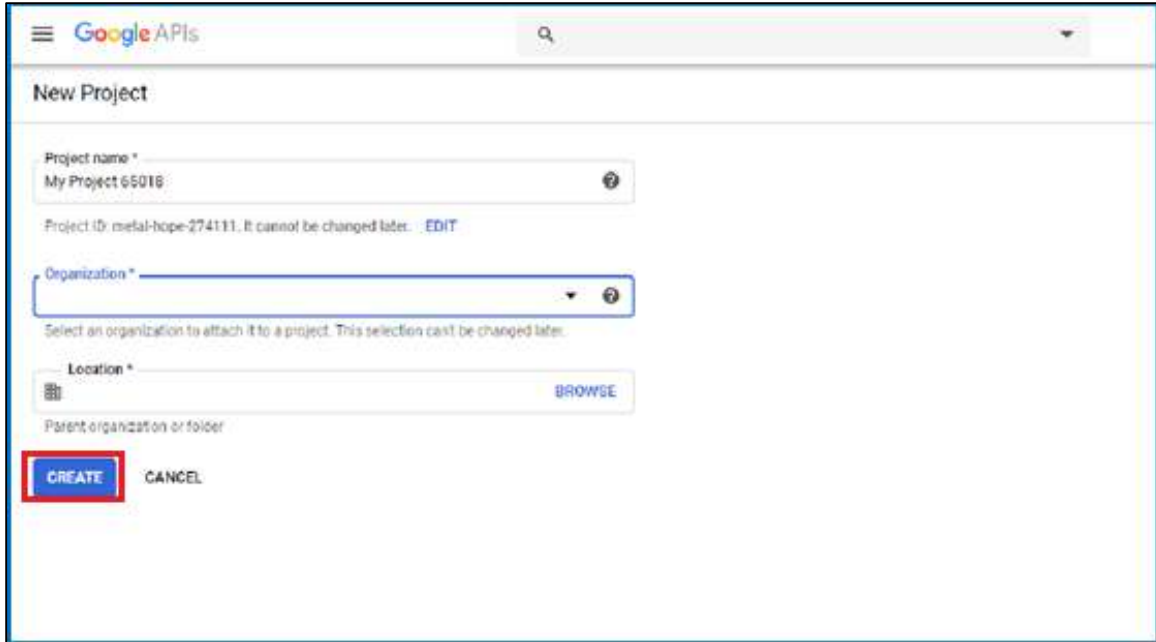

## 20 Appendix 18: Google Workspace: Generate Refresh Token

### 20.1 Enable APIs

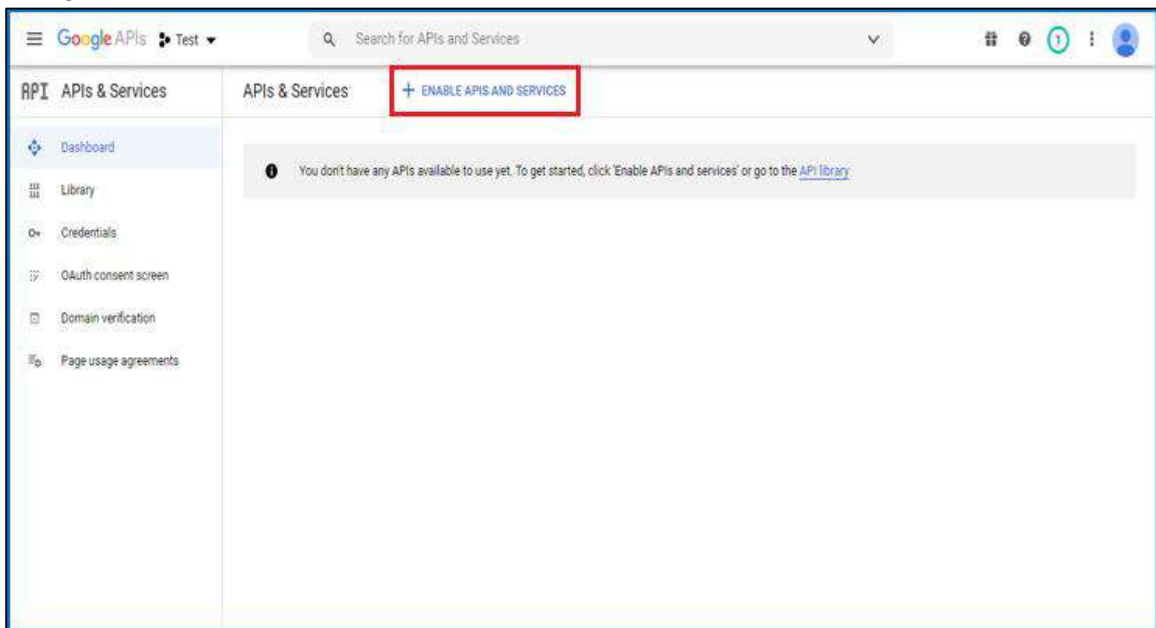

1. Go to the [Google Developer Console](#).
2. Click **Select a Project >> New Project**. If you have an existing project, you can select it from **ALL**.

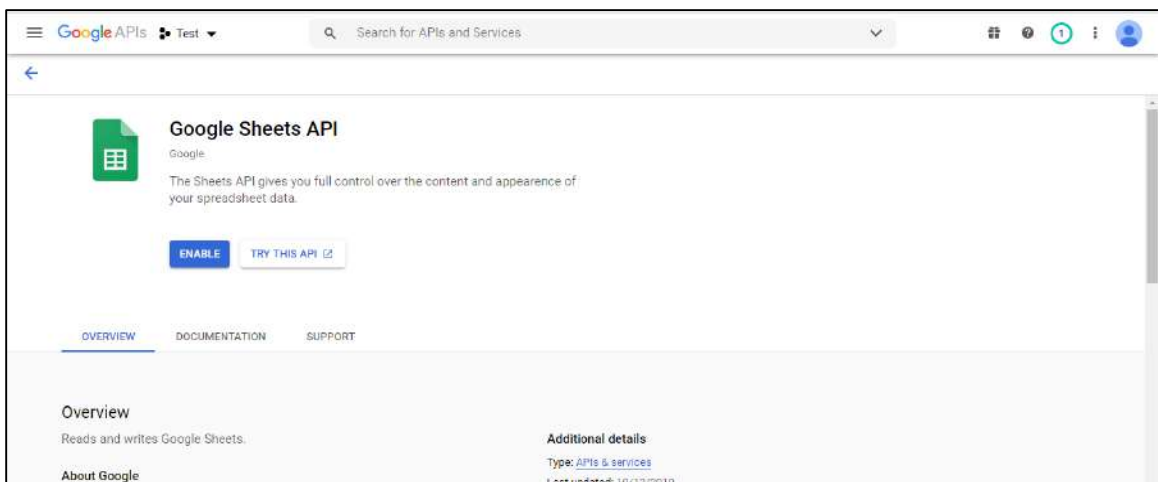

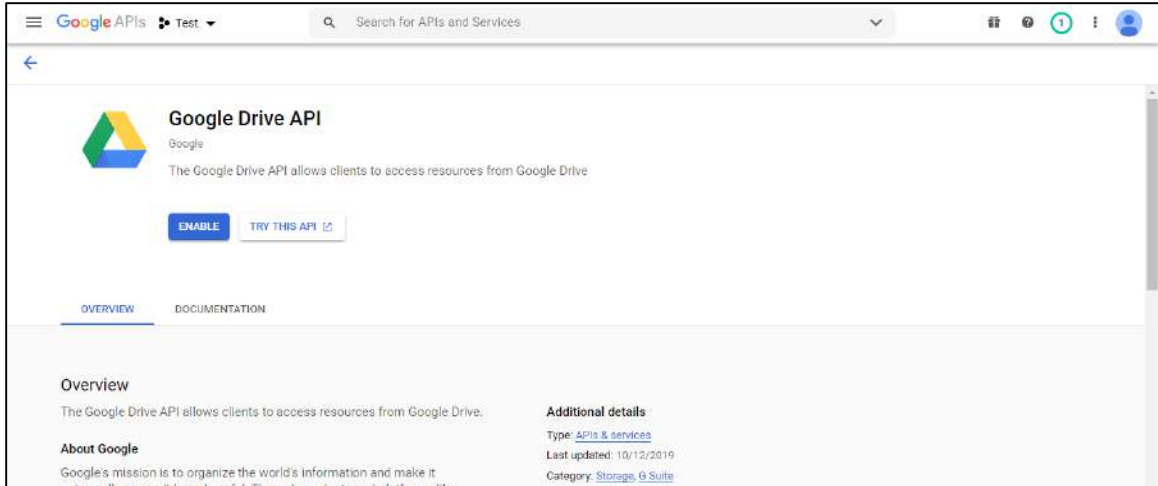

3. Provide valid values, and click **Create**.

4. Navigate to **Dashboard**, and click on **ENABLE APIS AND SERVICES**.

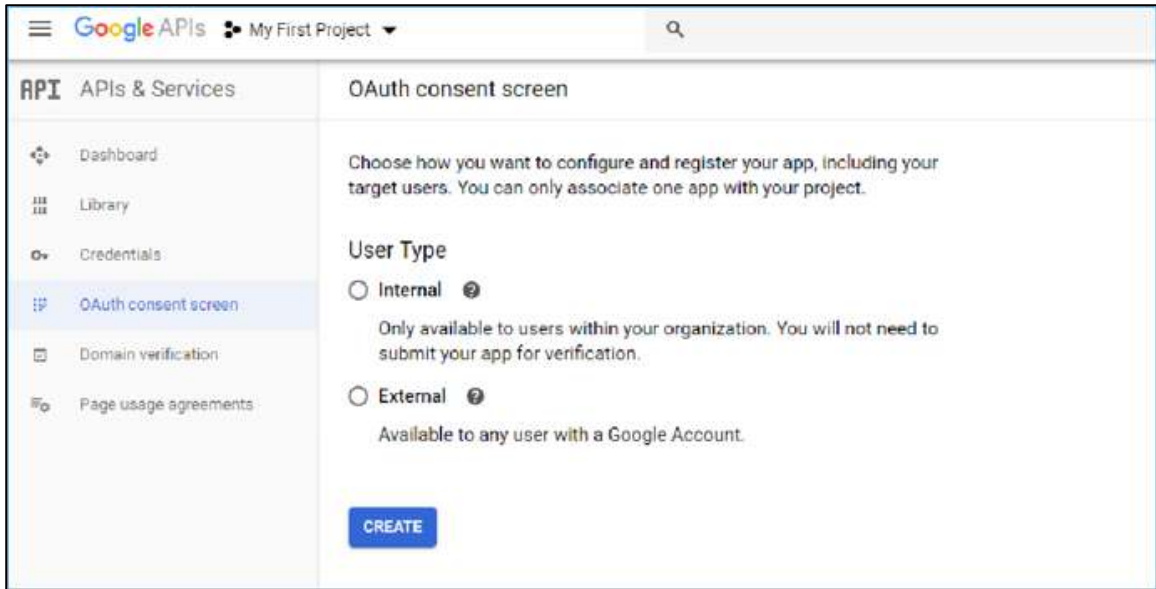

5. Search for **Google Drive API** and **Google Sheets API**, and click **Enable**.

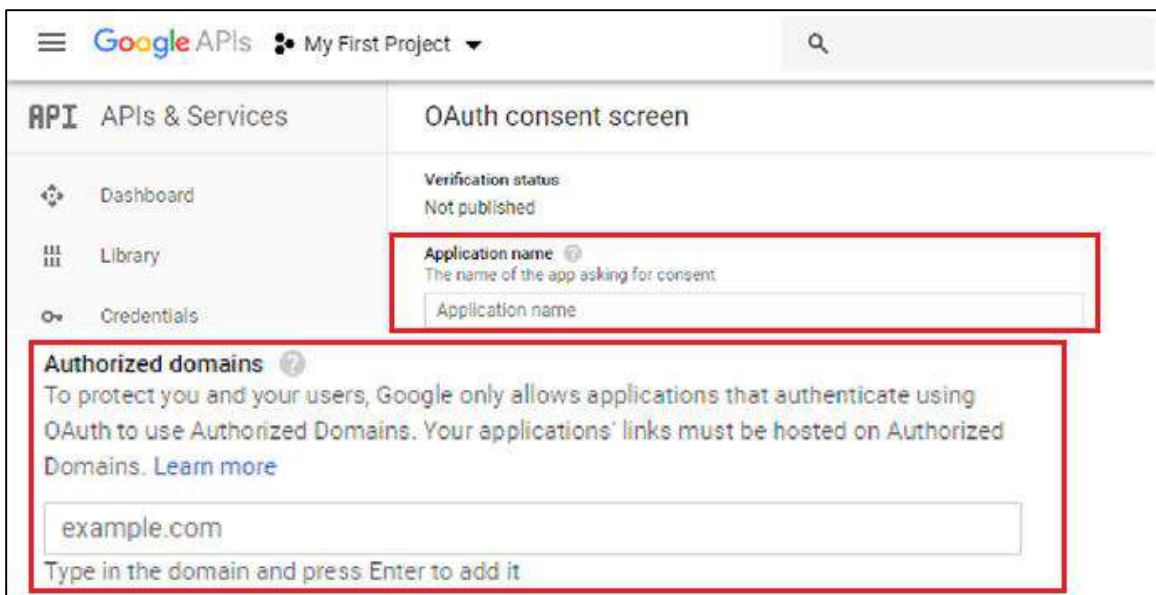

## 20.2 Get a Client ID and Client Secret

1. Navigate to the tab **OAuth consent screen** and choose the valid option.

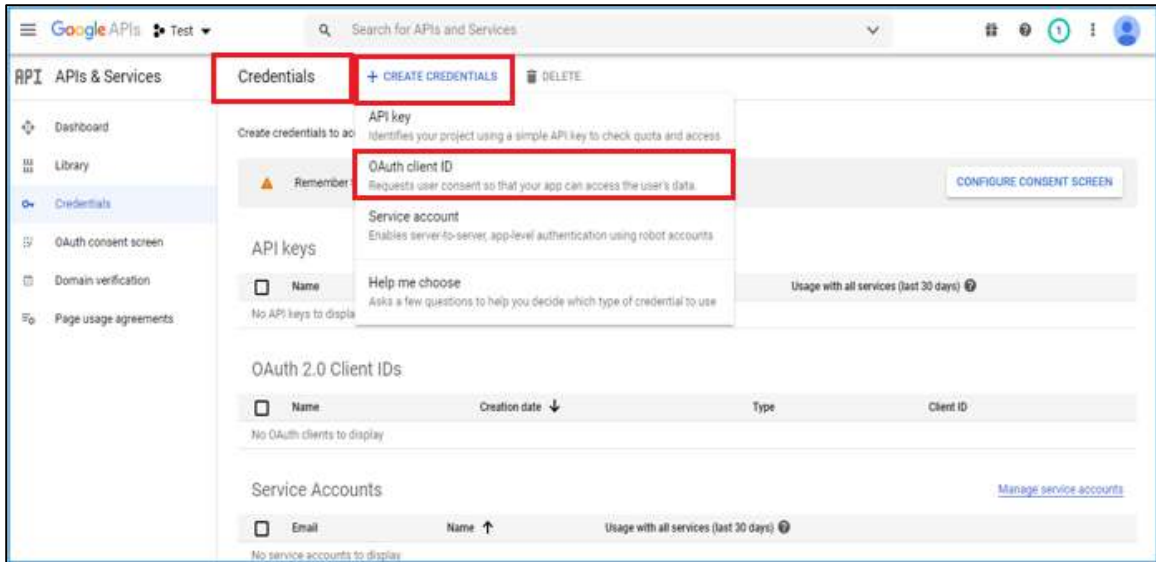

2. Enter the **Application name** and **Authorized domains**, and click **Save**.

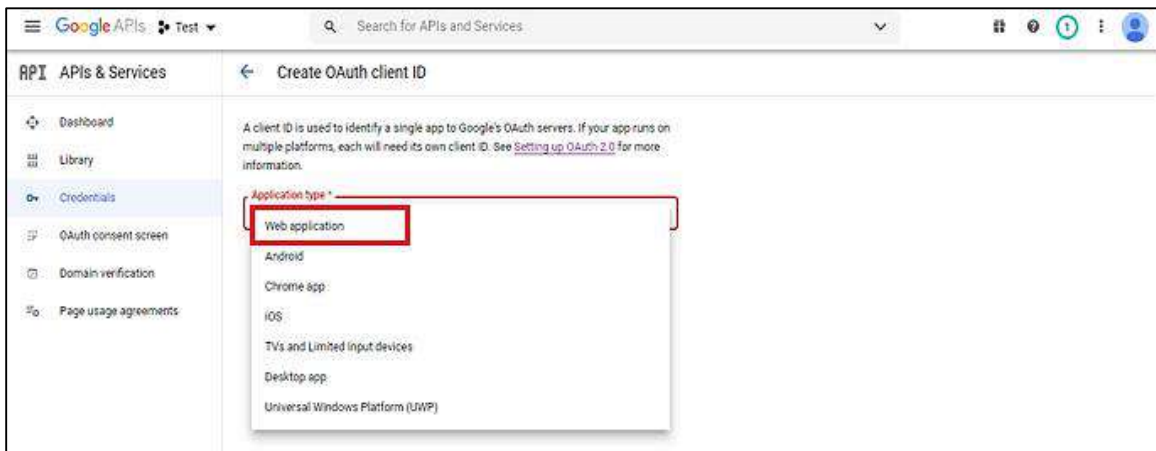

3. Click **Credentials** tab >> **Create Credentials**, and **OAuth client ID** from the dropdown list.

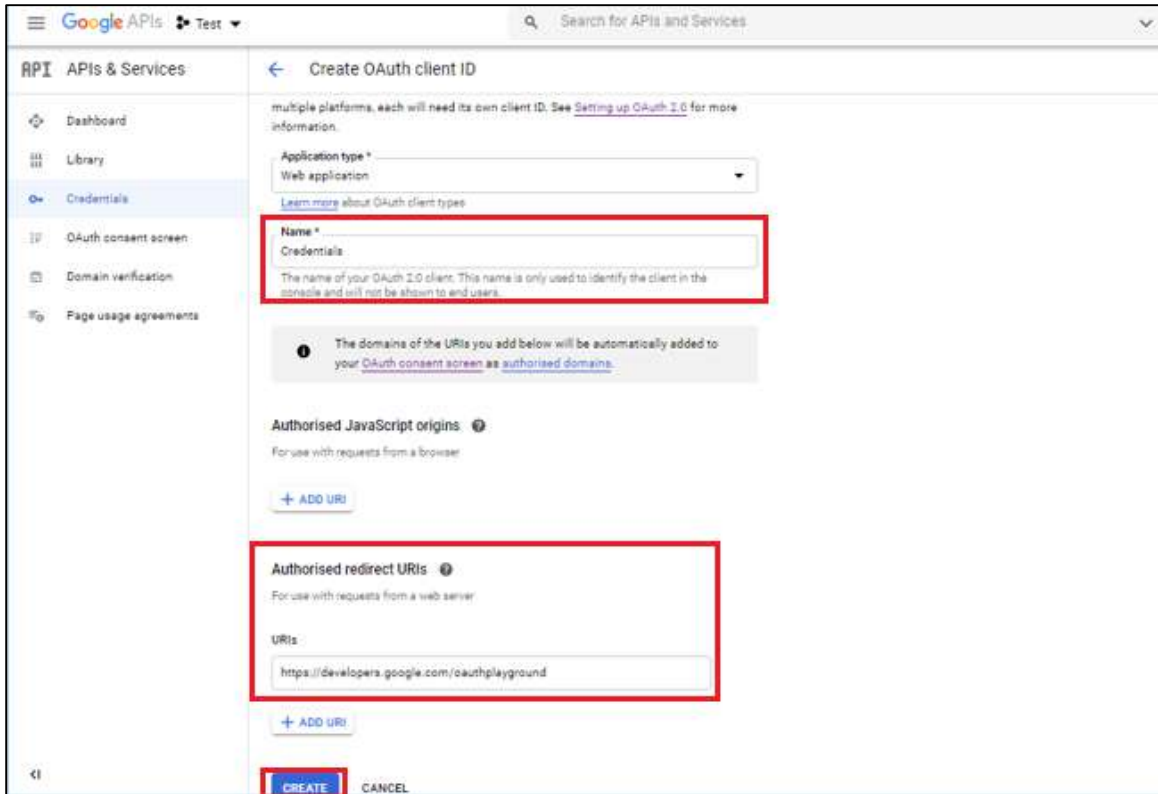

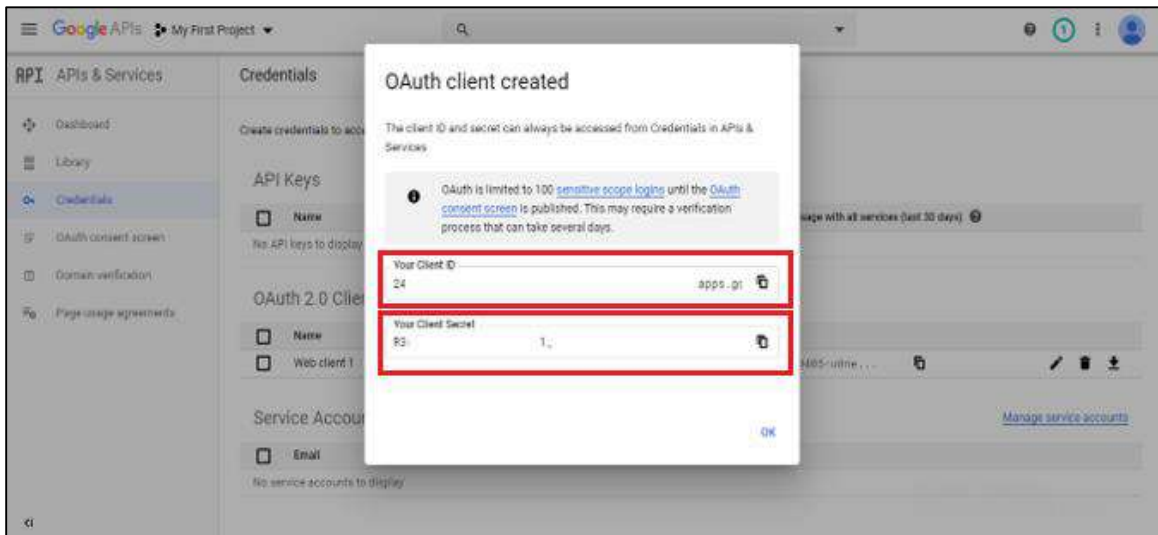

4. In the **Application type** list, select **Web Application**.

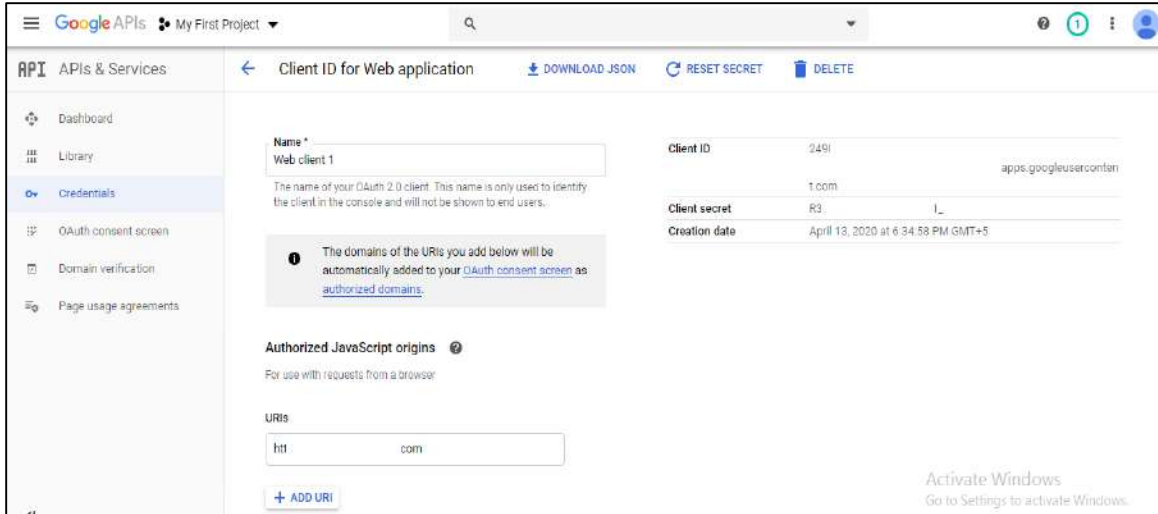

5. Enter valid **Name** and **Authorized Redirect URIs**, and click **Create**.

6. Copy **Client ID** and **Client Secret**, and click **OK**.

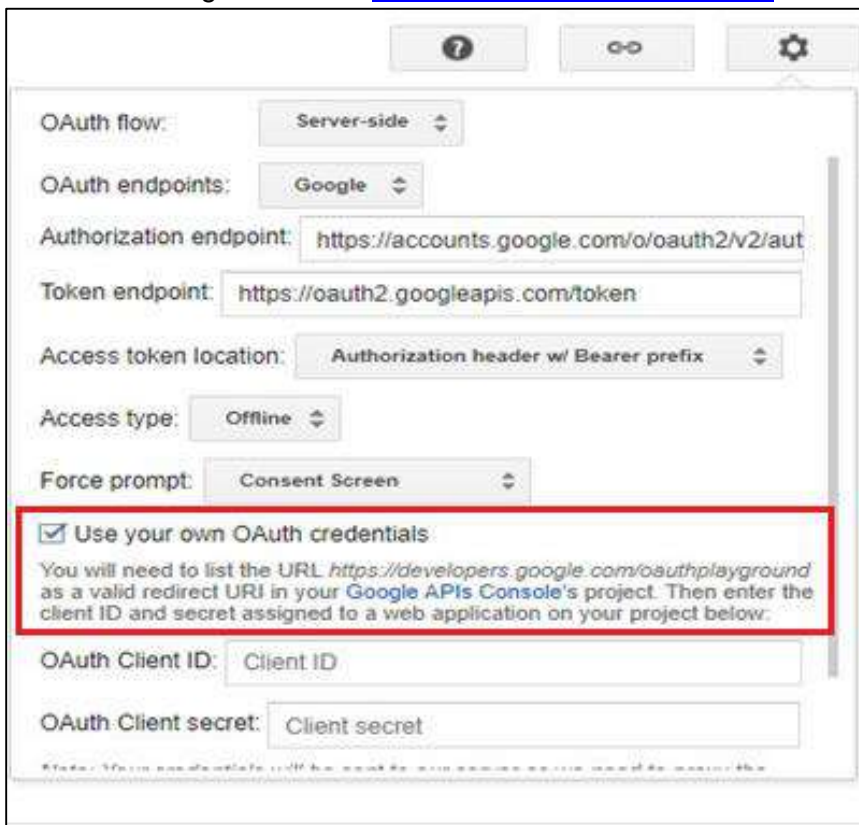

7. Click **OAuth 2.0 Client IDs**, and get Client ID and Client Secret.

### 20.3 Generate Refresh Token

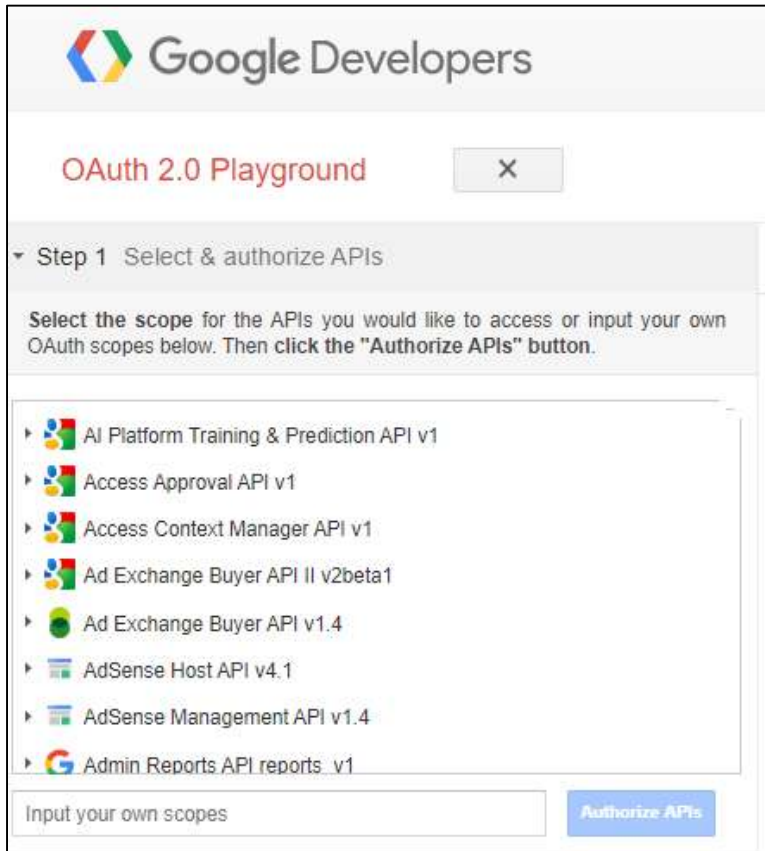

11. Go to the [Google OAuth Playground](#).
12. Click **Settings** icon.
13. Click **Use your own OAuth credentials**, and enter **OAuth Client ID** and **OAuth Client secret** generated in [Get Client ID and Client Secret](#).

14. Select **Select & authorize APIs**. Select the desired scope you want for your application and click on **Authorize APIs**.

**Required Scope:**

<https://www.googleapis.com/auth/admin.directory.user>  
<https://www.googleapis.com/auth/admin.directory.domain>  
<https://www.googleapis.com/auth/admin.directory.group>

15. Click on **Exchange authorization code for tokens**.

▼ Step 2 Exchange authorization code for tokens

Once you got the Authorization Code from Step 1 click the **Exchange authorization code for tokens** button, you will get a refresh and an access token which is required to access OAuth protected resources.

Authorization code:

**Exchange authorization code for tokens**

Refresh token:

Access token:

Auto-refresh the token before it expires.

The access token will expire in **3587** seconds.

Note: The OAuth Playground will automatically revoke refresh tokens after 24h. You can avoid this by specifying your own application OAuth credentials using the Configuration panel.

16. You'll get the **Authorization code**, click on the **Exchange authorization code for tokens** button.
17. Copy **Refresh Token**.

## 21 Appendix 19: Docker Installation and Connection Setup

### 21.1 Install Docker and Ubuntu

Docker Engine is available on a variety of Linux platforms, macOS and Windows 10 through Docker Desktop, and as a static binary installation. In this document Ubuntu installation steps described if you have other OS the follow this link: <https://docs.docker.com/engine/install/>

To get started with Docker Engine on Ubuntu, make sure you meet the prerequisites, then install Docker.

#### 21.1.1 Prerequisites

To install Docker Engine, you need the 64-bit version of one of these Ubuntu versions:

- Ubuntu Hirsute 21.04
- Ubuntu Groovy 20.10
- Ubuntu Focal 20.04 (LTS)
- Ubuntu Bionic 18.04 (LTS)

Docker Engine is supported on x86\_64 (or amd64), armhf, arm64, and s390x architectures.

You can install Docker Engine in different ways, depending on your needs: Most users set up Docker's repositories and install from them, for ease of installation and upgrade tasks. This is the recommended approach.

### 21.1.2 Install Docker repository

Before you install Docker Engine for the first time on a new host machine, you need to set up the Docker repository. After setting up the Docker repository, install and update Docker from the repository.

### 21.1.3 Set up the repository

1. Update the apt package index and install packages to allow apt to use a repository over HTTPS:

```
$ sudo apt-get update
```

```
$ sudo apt-get install \
apt-transport-https \
ca-certificates \
curl \
gnupg \
lsb-release
```

2. Add Docker's official GPG key:

```
$ curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo gpg --dearmor -o \
/usr/share/keyrings/docker-archive-keyring.gpg
```

3. Use the following command to set up the **stable** repository.

**Note:** The `lsb_release -cs` sub-command below returns the name of your Ubuntu distribution, such as xenial. Sometimes, in a distribution like Linux Mint, you might need to change `lsb_release -cs` to your parent Ubuntu distribution. For example, if you are using Linux Mint Tessa, you could use bionic. Docker does not offer any guarantees on untested and unsupported Ubuntu distributions.

```
echo \
"deb [arch=$(dpkg --print-architecture) signed-by=/usr/share/keyrings/docker-archive- \
keyring.gpg] https://download.docker.com/linux/ubuntu \
$(lsb_release -cs) stable" | sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
```

### 21.1.4 Install Docker Engine

- a. Update the apt package index, and install the **latest version** of Docker Engine and containerID, or go to the next step to install a specific version:

```
$ sudo apt-get update
```

```
$ sudo apt-get install docker-ce docker-ce-cli containerd.io
```

- b. To install a **specific version** of Docker Engine, list the available versions in the repo, then select and install:

- a. List the versions available in your repo:

```
$ apt-cache madison docker-ce
```

- b. Install a specific version using the version string from the second column, for example, 5:18.09.1~3-0~ubuntu-xenial

```
$ sudo apt-get install docker-ce=<VERSION_STRING> docker-ce-cli=<VERSION_STRING> containerd.io
```

- c. Verify that Docker Engine is installed correctly by running the hello-world image.

```
$ sudo docker run hello-world
```

For more information refer to the following link:

<https://docs.docker.com/engine/install/ubuntu>

## 21.2 Protect the Docker daemon socket

By default, Docker runs through a non-networked UNIX socket. It can also optionally communicate using SSH or a TLS (HTTPS) socket.

### 21.2.1 Use TLS (HTTPS) to protect the Docker daemon socket

**Note:** Client need to install docker engine on their machine to use this configuration type.

If you need Docker to be reachable through HTTPS rather than SSH in a safe manner, you can enable TLS (HTTPS) .

In the daemon mode, it only allows connections from clients authenticated by a certificate signed by that CA. In the client mode, it only connects to servers with a certificate signed by that CA.

1. Create a CA, server, and client keys with OpenSSL

First, on the Docker daemon's host machine, generate CA private and public keys:

```
$ openssl genrsa -aes256 -out ca-key.pem 4096
```

```
$ openssl req -new -x509 -days 365 -key ca-key.pem -sha256 -out ca.pem
```

--- Provide all required fields.

For common name field, provide Hostname(\$hostname -fqdn Use this command to get hostname for Ubuntu)

2. Now that you have a CA, you can create a server key and certificate signing request (CSR). Make sure that “Common Name” matches the hostname you use to connect to Docker:

```
$ openssl genrsa -out server-key.pem 4096
```

**Note:** Replace all instances of \$HOST in the following example with the DNS name of your Docker daemon’s host. Or set the HOST using **\$ export HOST=10.10.10.10**(Host IP Address or DNS name) this command.

```
$ openssl req -subj "/CN=$HOST" -sha256 -new -key server-key.pem -out server.csr
```

Next, we’re going to sign the public key with our CA:

3. Since TLS connections can be made through IP address as well as DNS name, the IP addresses need to be specified when creating the certificate. For example, to allow connections using 10.10.10.10 and 127.0.0.1:

```
$ echo subjectAltName = DNS:$HOST,IP:10.10.10.10,IP:127.0.0.1 >> extfile.cnf
```

4. Set the Docker daemon key’s extended usage attributes to be used only for server authentication:

```
$ echo extendedKeyUsage = serverAuth >> extfile.cnf
```

5. Now, generate the signed certificate:

```
$ openssl x509 -req -days 365 -sha256 -in server.csr -CA ca.pem -CAkey ca-key.pem \
 -CAcreateserial -out server-cert.pem -extfile extfile.cnf
```

6. For client authentication, create a client key and certificate signing request:

**Note:** For simplicity of the next couple of steps, you may perform this step on the Docker daemon’s host machine as well.

```
$ openssl genrsa -out key.pem 4096
```

```
$ openssl req -subj '/CN=client' -new -key key.pem -out client.csr
```

7. To make the key suitable for client authentication, create a new extensions config file:

```
$ echo extendedKeyUsage = clientAuth > extfile-client.cnf
```

8. Now, generate the signed certificate:

```
$ openssl x509 -req -days 365 -sha256 -in client.csr -CA ca.pem -CAkey ca-key.pem \
 -CAcreateserial -out cert.pem -extfile extfile-client.cnf
```

9. After generating cert.pem and server-cert.pem you can safely remove the two certificate signing requests and extensions config files:

```
$ rm -v client.csr server.csr extfile.cnf extfile-client.cnf
```

10. To protect your keys from accidental damage, remove their write permissions. To make them only readable by you, change file modes as follows:

```
$ chmod -v 0400 ca-key.pem key.pem server-key.pem
```

Certificates can be world-readable, but you might want to remove write access to prevent accidental damage:

```
$ chmod -v 0444 ca.pem server-cert.pem cert.pem
```

11. Now you can make the Docker daemon only accept connections from clients providing a certificate trusted by your CA:

```
$ dockerd \
 --tlsverify \
 --tlscacert=ca.pem \
 --tlscert=server-cert.pem \
 --tlskey=server-key.pem \
 --H=0.0.0.0:2376
```

If you want to configure Docker to accept remote connections using the docker.service systemd unit files for Linux distributions, such as recent versions of RedHat, CentOS, Ubuntu, and SLES. Then follow the following steps.

- a) Use the command **\$ sudo systemctl edit docker.service** to open an override file for docker.service in a text editor.
- b) Add or modify the following lines, substituting your own values.
 

```
[Service]
ExecStart=
ExecStart=/usr/bin/dockerd -H fd:// -H tcp://0.0.0.0:2376 --tlsverify --
tlscacert=ca.pem --tlscert=server-cert.pem --tlskey=server-key.pem
```
- c) Save the file

- d) Reload the systemctl configuration.  
\$ *sudo systemctl daemon-reload*
- e) Restart Docker.  
\$ *sudo systemctl restart docker.service*

Follow this link for more details.

<https://docs.docker.com/engine/install/linux-postinstall/#configuring-remote-access-with-systemd-unit-file>

12. To connect to docker and validate its certificate, you need to copy your client keys(key.pem), certificates(cert.pem) and trusted CA(ca.pem) to client machine and provide these certificates to Docker plugin steps.

### 21.2.2 Secure by default

If you want to secure your Docker client connections by default, you can move the files to the `.docker` directory in your home directory and set the **DOCKER\_HOST** and **DOCKER\_TLS\_VERIFY** variables as well.

Then no need to provide the certificates and Docker Host URI to docker plugins for docker connection.

For Ubuntu:

```
$ export DOCKER_HOST=tcp://$HOST:2376 DOCKER_TLS_VERIFY=1
```

For more details:

<https://docs.docker.com/engine/security/protect-access/#use-tls-https-to-protect-the-docker-daemon-socket>

## 21.3 SSH Configuration

- To do SSH Connection, You need to run a daemon on UNIX socket.  
By default, the Docker daemon listens for connections on a UNIX socket to accept requests from local clients.

**Note:** To connect using this configuration type, there is no need to install docker engine on the client side.

- Provide the Server Name(Public IP Address), Port, Username, Password.
- You can also use both configuration types.  
While running Docker daemon use the following command:

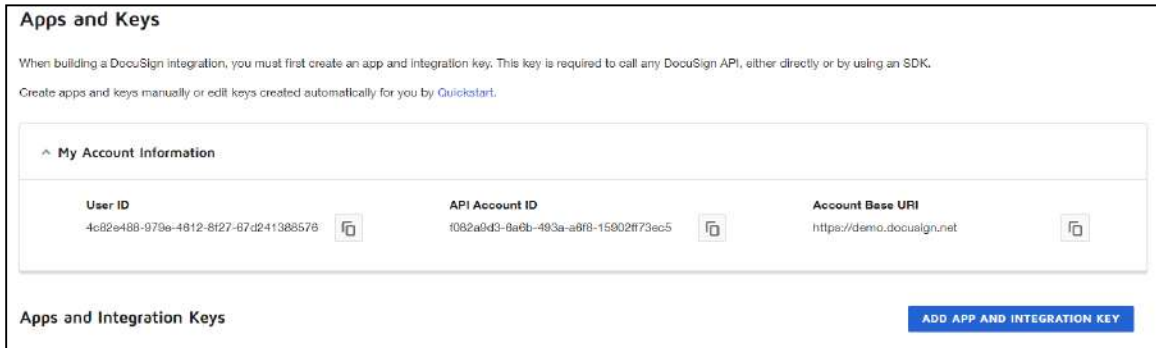

```
$ dockerd \
 --tlsverify \
 --tlscacert=ca.pem \
```

```
--tls-cert=server-cert.pem \
--tls-key=server-key.pem \
-H unix:///var/run/docker.sock \
-H=0.0.0.0:2376
```

## 22 Appendix 20: DocuSign: Generate Refresh Token

### 22.1 Generate Refresh Token

1. Go to <https://admindemo.docusign.com/apps-and-keys>, and sign-in to your DocuSign account.
2. Click ADD APP AND INTEGRATION KEY. The Add Integration Key dialog appears

**Apps and Keys**

When building a DocuSign integration, you must first create an app and integration key. This key is required to call any DocuSign API, either directly or by using an SDK.

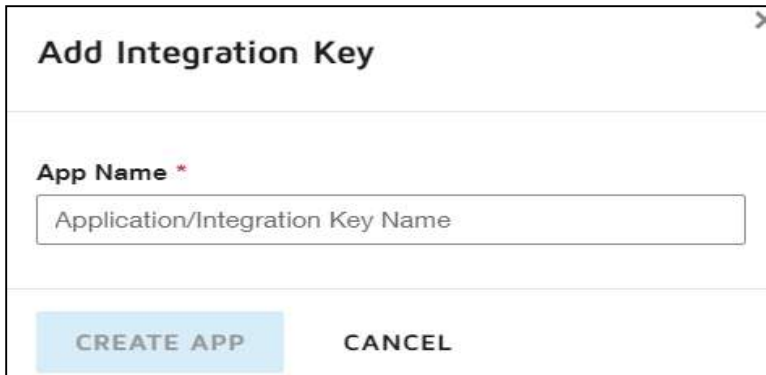

Create apps and keys manually or edit keys created automatically for you by Quickstart.

^ My Account Information

|                                                        |                                                               |                                                      |
|--------------------------------------------------------|---------------------------------------------------------------|------------------------------------------------------|
| <b>User ID</b><br>4c82e488-979e-4812-8127-87d241388578 | <b>API Account ID</b><br>f082a0d3-8a6b-493a-a8f8-15902ff73ec5 | <b>Account Base URI</b><br>https://demo.docusign.net |
|--------------------------------------------------------|---------------------------------------------------------------|------------------------------------------------------|

Apps and Integration Keys [ADD APP AND INTEGRATION KEY](#)

3. In the Add Integration Key dialog enter the App Name, and click CREATE APP.

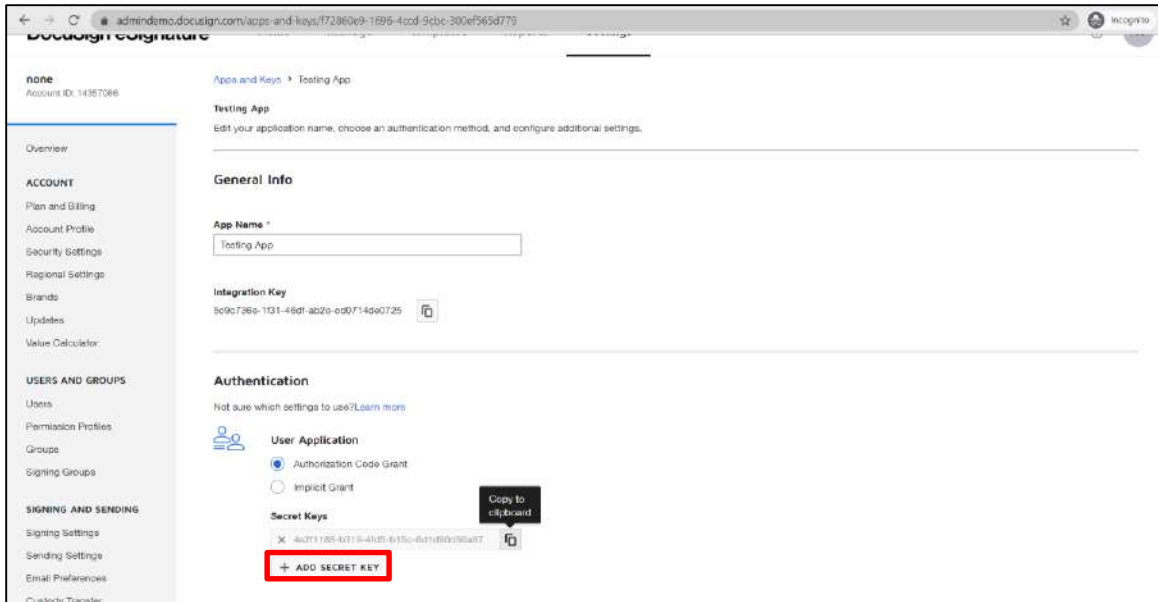

**Add Integration Key**

**App Name \***

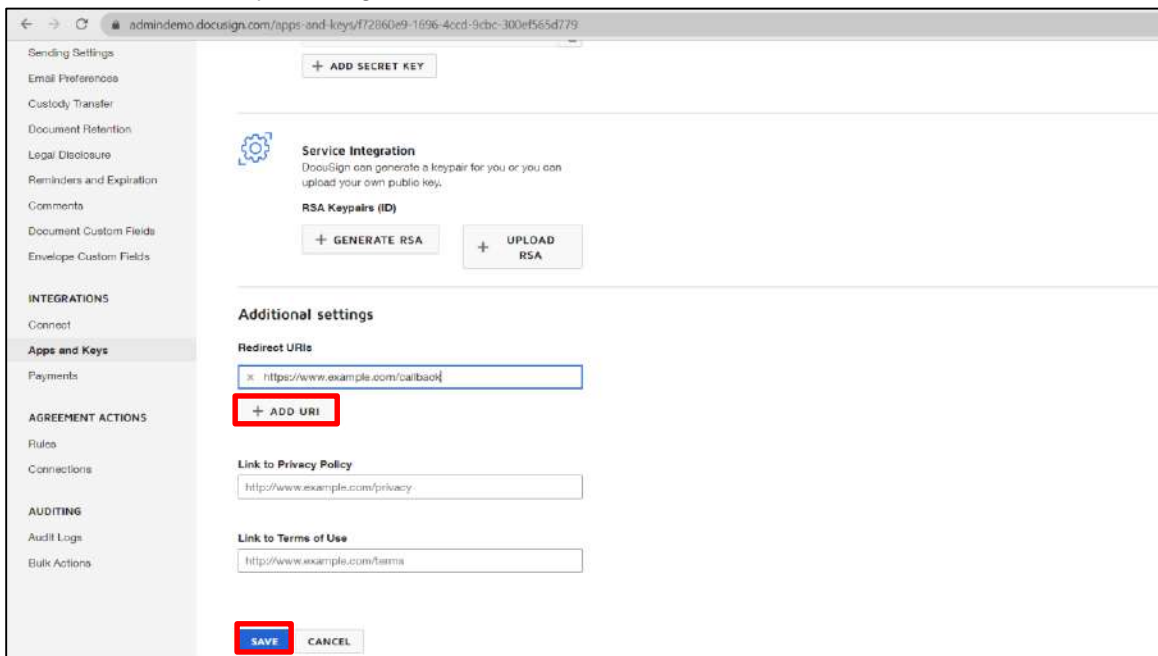

Application/Integration Key Name

[CREATE APP](#) [CANCEL](#)

4. Save the Integration Key copy with you.
5. Click ADD SECRET KEY to get secret key.

6. Copy and save the Secret Key with you.
7. Add Redirect URI by clicking on ADD URI.

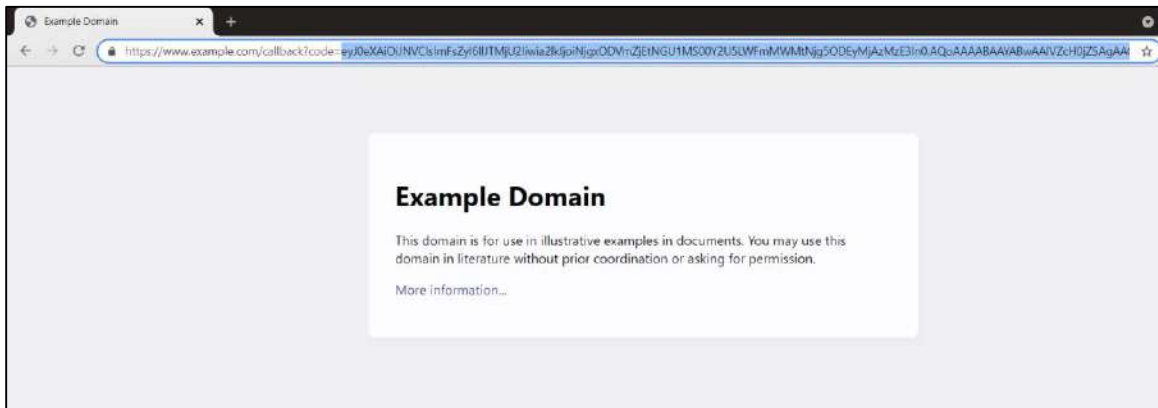

8. Add your URI, for example, <https://www.example.com/callback>, and save it with you. Click SAVE to save all the details.
9. Open browser and search the URL after replacing it with your app's Integration key and Redirect URI  
[https://account-d.docusign.com/oauth/auth?response\\_type=code&scope=signature&client\\_id=YOUR\\_APP\\_INTEGRATION\\_KEY&redirect\\_uri=YOUR\\_APP\\_REDIRECT\\_URI](https://account-d.docusign.com/oauth/auth?response_type=code&scope=signature&client_id=YOUR_APP_INTEGRATION_KEY&redirect_uri=YOUR_APP_REDIRECT_URI)

**Note:** After entering the URL on the browser you may need to verify yourself by giving your DocuSign Credentials.

- After you verify the details, a callback code is generated in the URL itself. Copy the Callback URL Code, and save it with you.

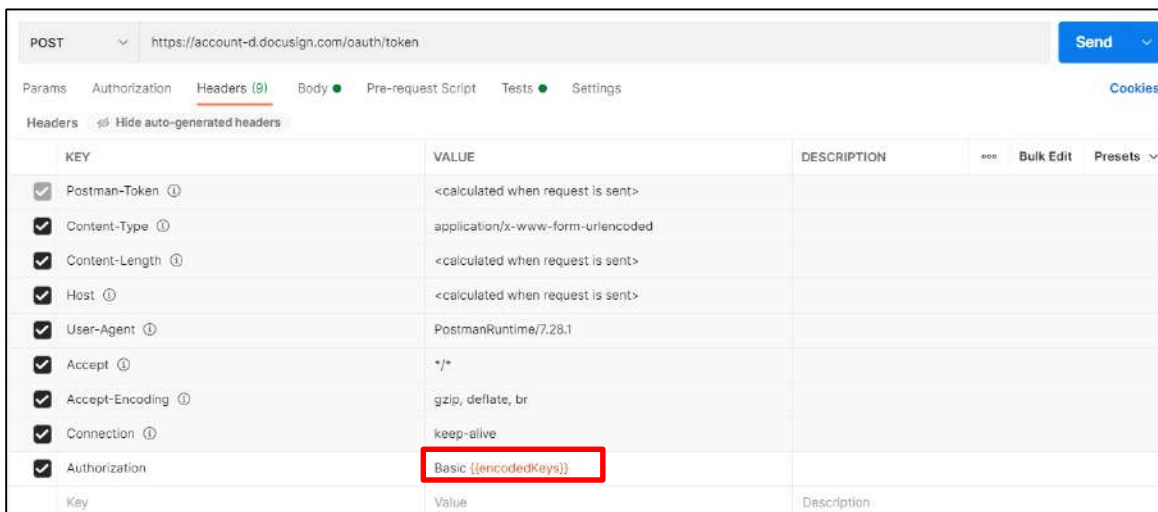

**Note:** The Callback URL Code expires in two minutes. You can regenerate it by calling the same URL in the browser.

- Go to Postman to generate a refresh token.
- In the POST page replace the VALUE for the following KEYS:

`{{codeFromUrl}}` with Callback URL Code.

`{{encodedKeys}}` with integration key and secret key, concatenated by a colon character as (Integration Key:Secret Key), converted into base64.

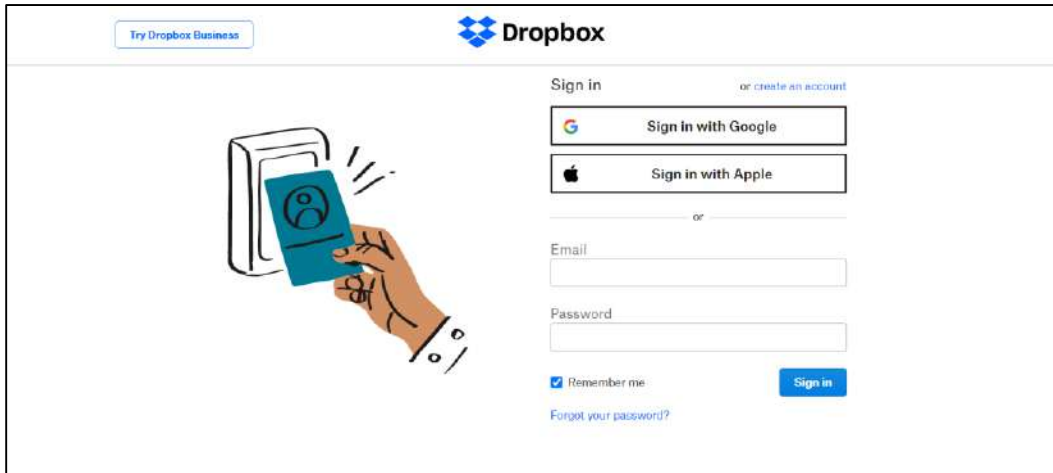

## 23 Appendix 21: Dropbox: App Registration and Refresh Token

### 23.1 Register App

1. Visit the Dropbox Apps registration portal using [Developer's Portal](#).
2. Sign in with Dropbox credentials.

3. On the page, click **Create App**. The app creation page appears.

4. On the page, complete the following process to create an app:
  - a. Choose an **API**.

- b. Select the type of access you need.

- c. Enter a unique app name.

- d. Click **Create App**, and then provide redirect URIs, such as <https://automationedge.com> or <http://localhost:8080>.

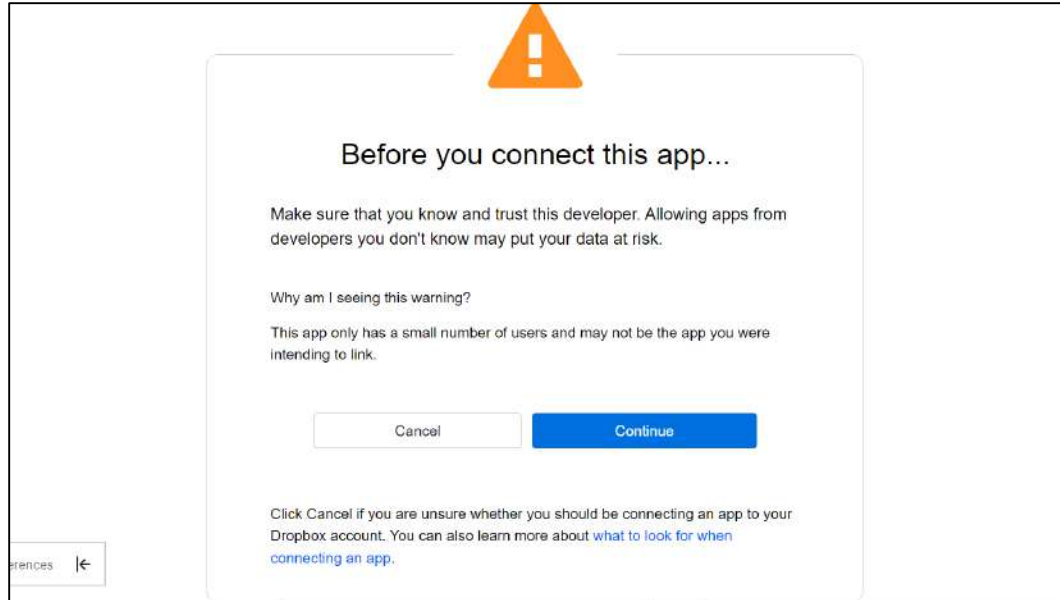

- e. To provide required permissions on App registration portal, click **Permissions** tab and provide the appropriate permissions defined in step documentation.

## 23.2 Generate Refresh Token URL and Run in browser

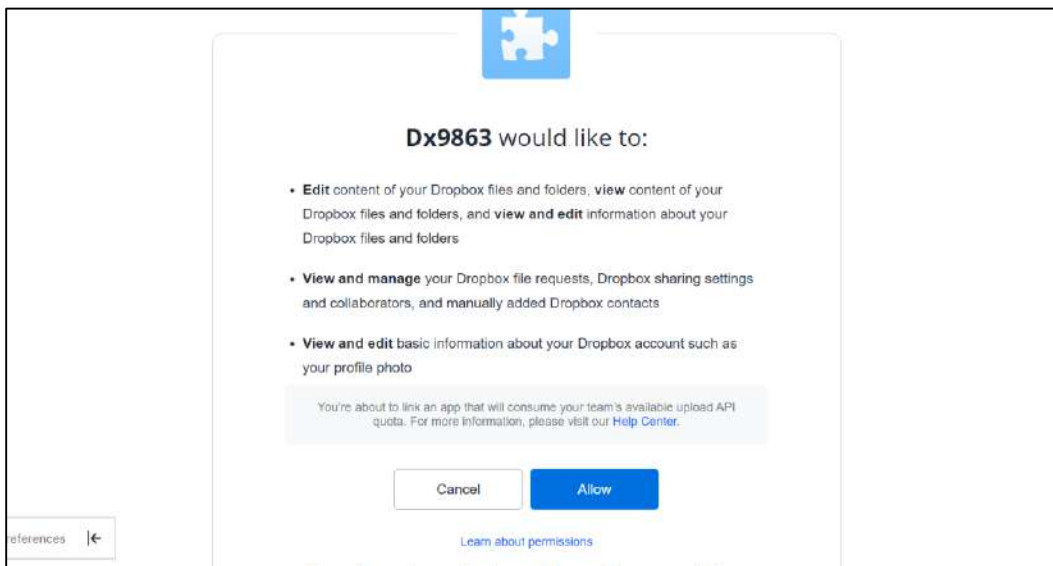

1. Call the following API in browser by adding the App Key and allow app to generate the authorization code:

[https://www.dropbox.com/oauth2/authorize?client\\_id=<AppKey>&token\\_access\\_type=offline&response\\_type=code](https://www.dropbox.com/oauth2/authorize?client_id=<AppKey>&token_access_type=offline&response_type=code)

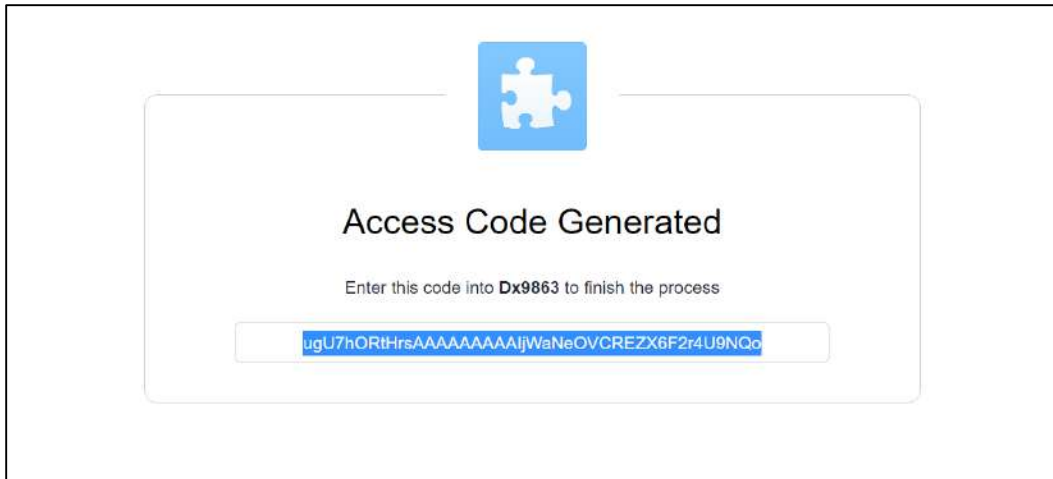

2. Click **Continue**, and then click **Allow**.

3. Copy the authorization code from **Access Code Generated**.

**Note:** The authorization code is valid for short period of time.

4. Create Post request in postman as follows:

POST <https://api.dropboxapi.com/oauth2/token>

Headers:

Content-Type: application/x-www-form-urlencoded

Authorization:

Select → basic auth and provide

Username: App Key

Password: App Secret

Body:

Select -> x-www-form-urlencoded

code: <authorization code generated in previous request>

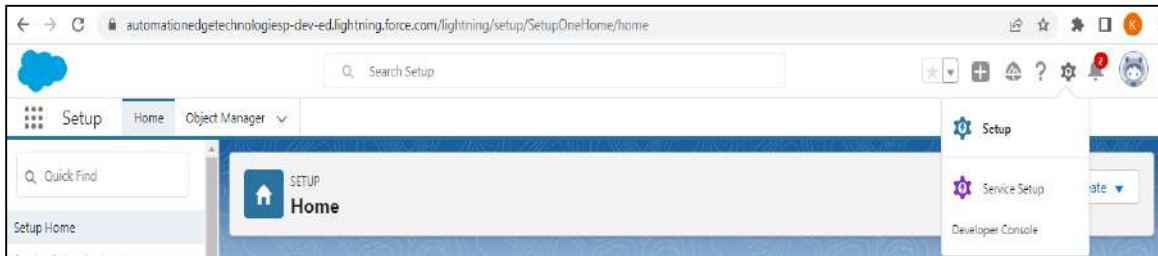

grant\_type: authorization\_code

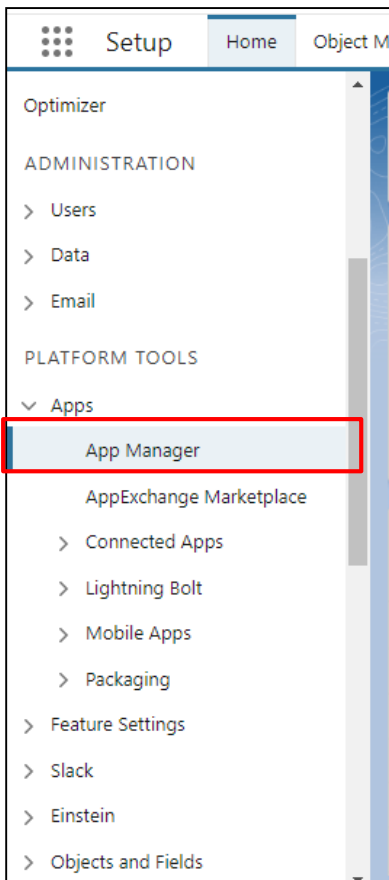

## 24 Appendix 24: Salesforce REST: Token Generation

### 24.1 Procedure to create Client ID/Consumer Key & Client Secret/Consumer Secret

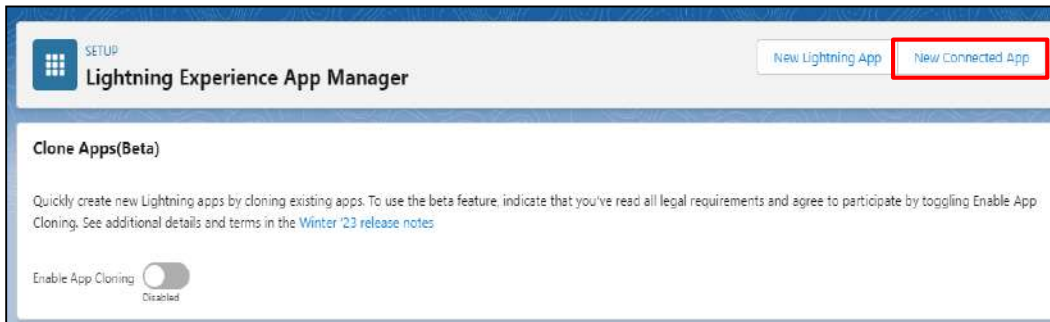

1. Go to your Salesforce site and log in.
2. Click on the Gear icon in the top right corner>> Select **Setup**.

3. In Platform tools>> **Select Apps>>App Manager**.

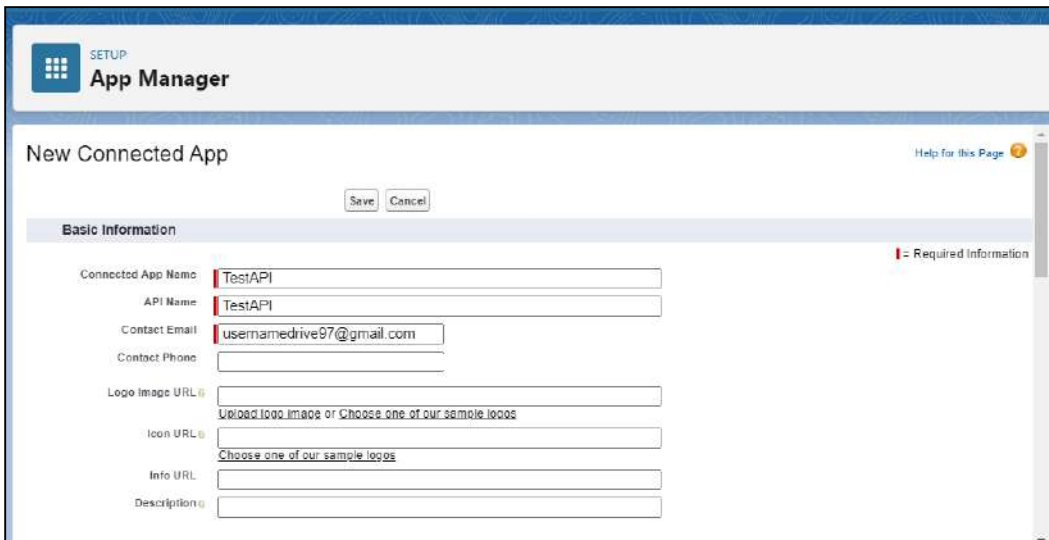

4. Click on **New Connected App**.

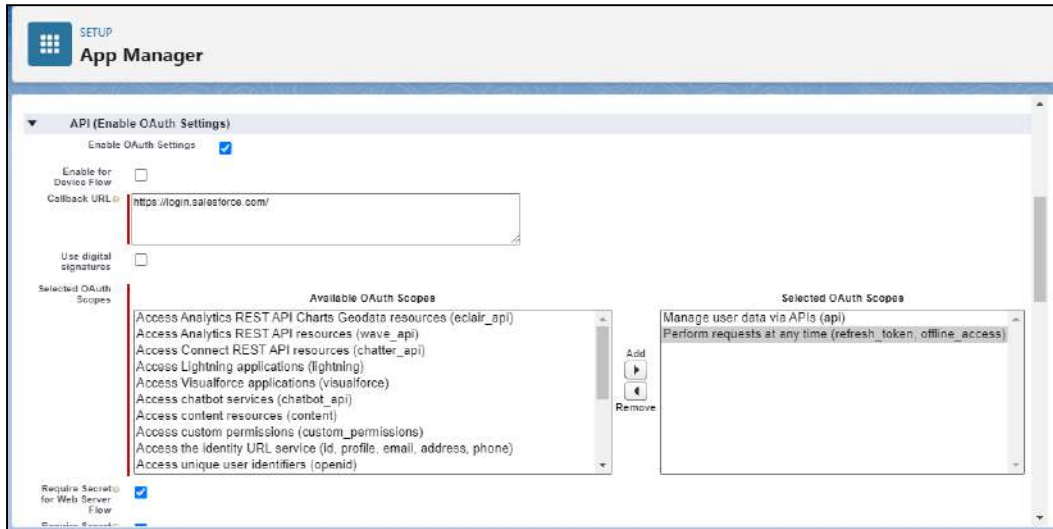

5. On the **New Connected App** page, fill in the following required fields under Basic Information:

- Connected App Name. For example, TestAPI.
- API name. For example, TestAPI.
- Valid Contact Email.

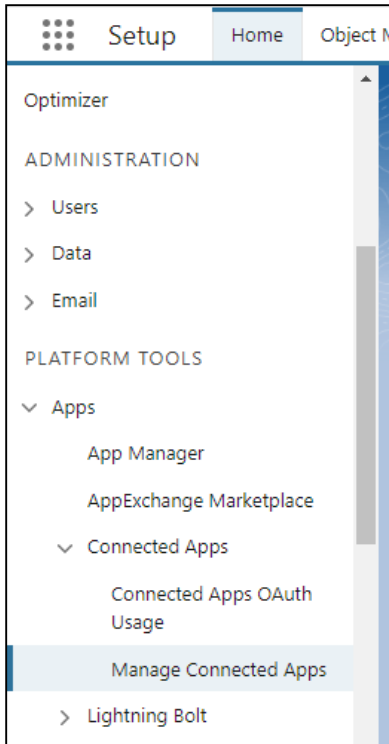

The screenshot shows the 'New Connected App' page in the 'App Manager'. The 'Basic Information' section is expanded, showing several input fields. The 'Connected App Name', 'API Name', and 'Contact Email' fields are filled with 'TestAPI', 'TestAPI', and 'username@drive97@gmail.com' respectively. A legend on the right indicates that red bars in the input fields denote required information. The 'Save' and 'Cancel' buttons are visible at the top of the form.

6. Scroll down to **API (Enable OAuth Settings)**, and select **Enable OAuth Settings**.
- In the **Callback URL** field, enter **https://login.salesforce.com/**.
  - In the **Selected OAuth Scopes** field, select **valid scopes as given in the screenshot**, and then click **Add**.

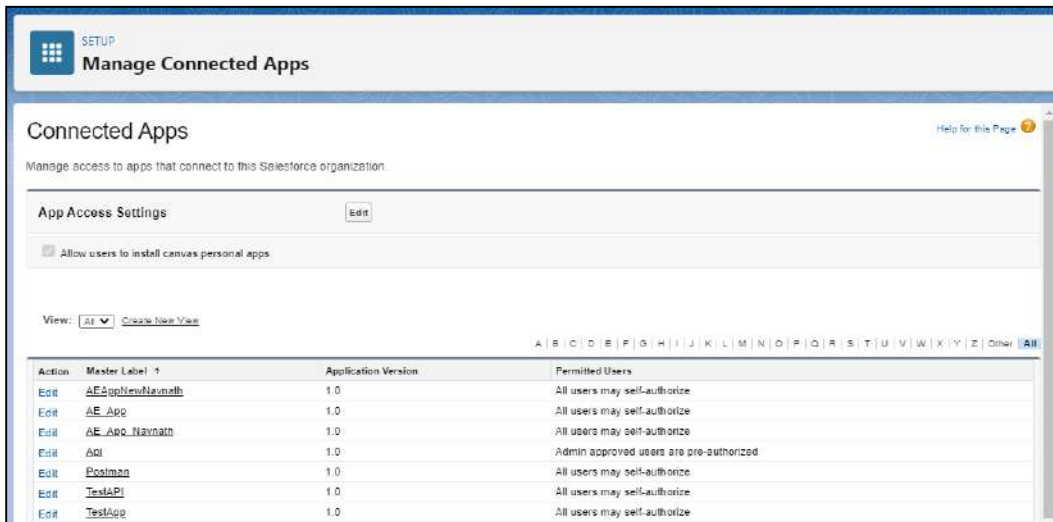

### Note:-

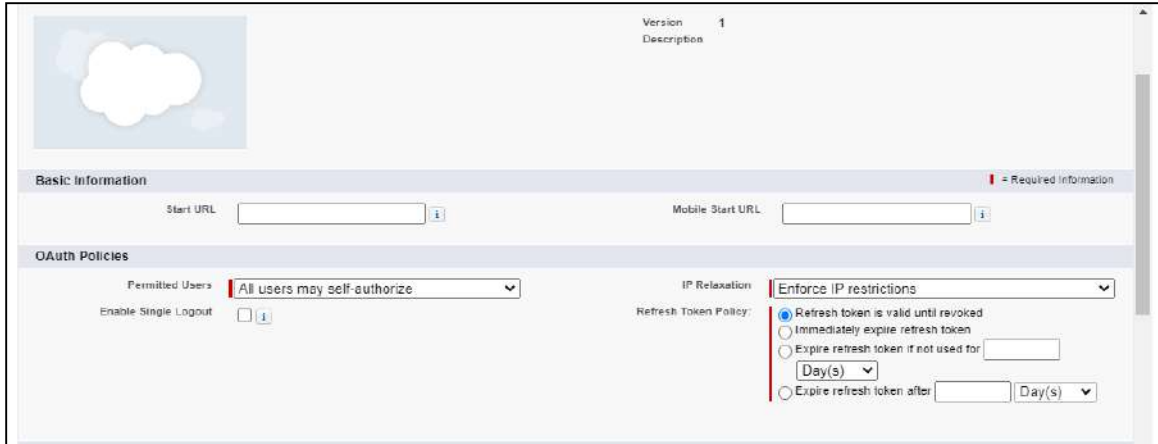

- a. The callback URL can be any valid URL, as shown in the screenshot. Note that Salesforce works only with the HTTPS protocol for all URLs, except localhost.
  - b. To get the Refresh Token, give Auth Scope (permission) **Perform requests at any time(refresh\_token, offline\_access)** from the Salesforce instance.
  - c. To get access to the Salesforce API, give **Manage user data via APIs(API)** permission.
7. Click the **Save** button to save the new Connected App.
  8. In Platform tools>> Select **Connected Apps>>Managed Connected Apps**.

9. In the **Connected Apps** list, find the App that you just created, and then click **Manage**.
  - a. On the page that opens, click the **Edit** button.

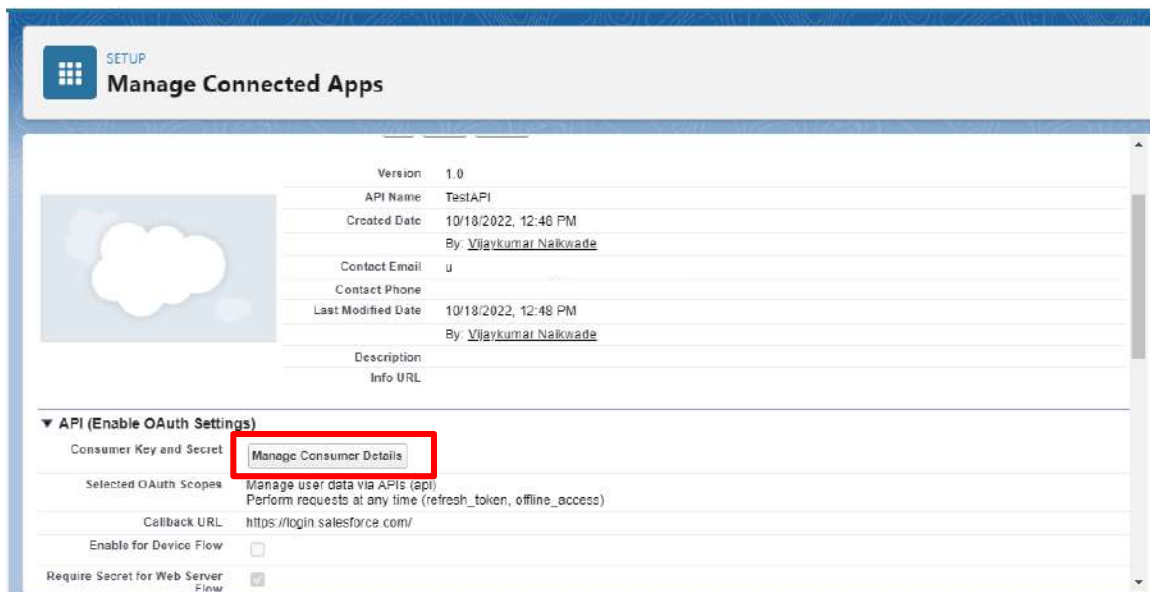

- b. Under **OAuth policies**, select **All users may self-authorize** in the **Permitted Users** list, and then click the **Save** button.

10. Go back to the **Connected Apps** list in App manager, click the App that you just created, and in the dropdown menu select **View**.

|                       |                    |                                                                 |                     |           |                                                                        |

| TestAPI               | TestAPI            |                                                                 | 10/18/2022, 1:03 PM | Connected | ▼                                                                      |
| TestApp               | TestApp            |                                                                 | 4/1/2022, 11:10 AM  | Connected | ▼                                                                      |

11. Go to API (Enable OAuth Settings), Click the Manage Consumer details button, and note down the **Client ID/Consumer Key** and **Client Secret/Consumer Secret**.

Connected App Name  
**TestAPI**

[Back to Manage Connected Apps](#)

**Consumer Details**

Consumer Key

---

Consumer Secret

## 24.2 Procedure to create Refresh Token

### 1. Request an Authorization Code

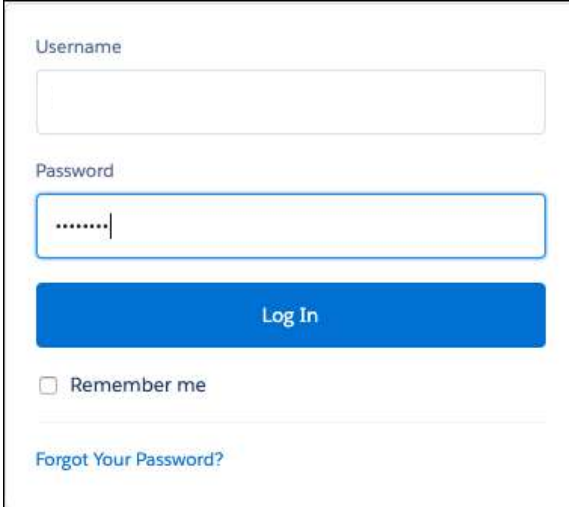

- a. The authorization code is made in the form of an HTTP redirect, such as the following request.

```
https://{{DomainName}}.my.salesforce.com/services/oauth2/authorize?
client_id={{clientID}}&redirect_uri={{callbackURL}}&response_type=code
```

**For example:** [https://automationedgetechnologiesp-dev-ed.my.salesforce.com/services/oauth2/authorize?client\\_id=3MVG9pRzvb6mBwotZXF8sA3n2Ykjl2X7wi.hfae0MprU1m1ZI9&redirect\\_uri=https://login.salesforce.com/&response\\_type=code](https://automationedgetechnologiesp-dev-ed.my.salesforce.com/services/oauth2/authorize?client_id=3MVG9pRzvb6mBwotZXF8sA3n2Ykjl2X7wi.hfae0MprU1m1ZI9&redirect_uri=https://login.salesforce.com/&response_type=code)

**Note:**

- DomainName – The instance name of your Salesforce instance.
  - client\_id - The consumer key of the connected app.
  - redirect\_uri - The URL where users are redirected after successful authentication. The redirect URI must match one of the values in the connected app's Callback URL field. Otherwise, the approval fails.
  - response\_type - The value for this flow must be "code" to indicate that the connected app is requesting an authorization code.
- b. Now go to your desired browser and search this URL after replacing it with your app's client id/consumer key and Redirect URI.
  - c. Before Salesforce provides authorization codes to connected apps, the authenticating users are asked to log in to Salesforce. Provide a valid username and password.

Username

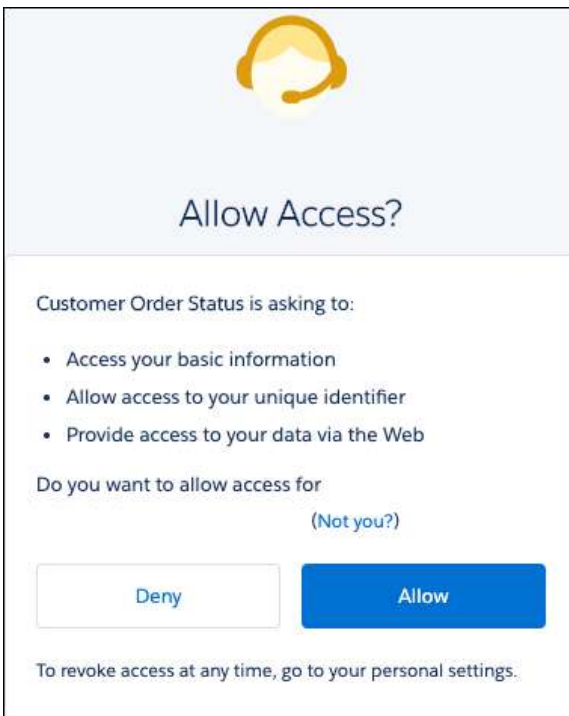

Password

[Log In](#)

Remember me

[Forgot Your Password?](#)

- d. After a successful login, Salesforce redirects users to the approval page to grant access to the app.

## Allow Access?

Customer Order Status is asking to:

- Access your basic information
- Allow access to your unique identifier
- Provide access to your data via the Web

Do you want to allow access for  
(Not you?)

[Deny](#) [Allow](#)

To revoke access at any time, go to your personal settings.

## 2. Salesforce Grants Authorization Code

After users approve access to a connected app, Salesforce redirects users to the call back URL, where they can view the call back with an authorization code.

<https://login.salesforce.com/?code=aPrx0jWjRo8KRXuAzFrwZnnxHq9GdqyFmDttQJMANnGVcTTVyJZgC1Y5CQbJFtZgPegjZv15pg%3D%3D>

- The first part of the call back is the connected app's call back URL: <https://login.salesforce.com>
- The second part is the authorization code that the connected app uses to get an access token: `code=aPrx0jWjRo8KRXuAzFrwZnnxHq9GdqyFmDttQJMANnGVcTTVyJZgC1Y5CQbJFtZgPegjZv15pg==.`

#### Note:

- The “%3D%3D” in the code should be replaced by “==” or else the code will not work.
- The authorization code expires after 15 minutes.

### 3. Request a Refresh Token

- Open Postman to generate the refresh token.
- Make the following request:

#### POST:

`https://{{DomainName}}.my.salesforce.com/services/oauth2/token`

#### Body: x-www-form-urlencoded (key value pair)

`code:{{codeFromURL}} – Check point 2.`  
`client_id:{{clientID}}`  
`client_secret:{{clientSecret}}`  
`redirect_uri:{{redirectURI/CallbackURL}}`  
`grant_type:authorization_code`

#### Note:

- DomainName – The instance name of your Salesforce instance.
- code – The value got from requesting an authorization code.
- client\_id - The consumer key of the connected app.
- client\_secret - The consumer secret of the connected app.
- redirect\_uri - The URL where users are redirected after successful authentication. The redirect URI must match one of the values in the connected app's Callback URL field. Otherwise, the approval fails.
- grant\_type - The value for this flow must be “**authorization\_code**”.

#### Request:
