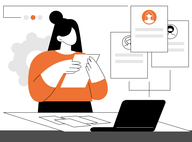
AutomationEdge

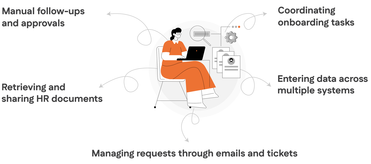
Your HRMS Is in Place. What's Holding HR Back?



Your HRMS stores employee data, payroll information, leave balances, and HR documents. Yet many HR processes still depend on manual work. An intelligent action layer helps turn existing HR data into completed tasks.

Where HR Work Gets Stuck

HR teams often spend time managing repetitive requests instead of focusing on people and priorities.



From Manual Work to Automated Action

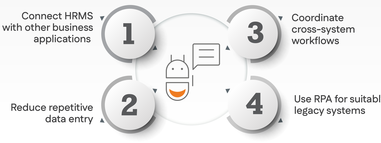
An action layer connects employee requests with the data, policies, and workflows needed to resolve them. This reduces manual effort across routine HR processes.

What Can You Automate?

Many routine HR activities can be automated using AI and workflow automation. This helps employees get faster service while reducing repetitive work for HR teams.

Connect Your Existing HR Systems

HR processes often span multiple applications, making coordination difficult. Automation helps connect systems and move information between tasks with less manual intervention.

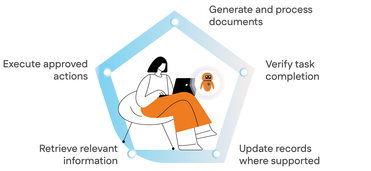


Keep People in Control

HR automation should follow organizational policies and access rules. Human oversight remains important for sensitive decisions, exceptions, and approvals.

Move Beyond Employee Queries

Answering an employee's question is only the first step. AI and automation can help complete eligible requests instead of leaving employees to follow up manually.

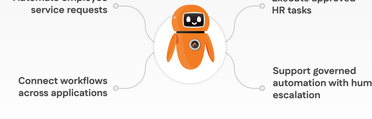


Get More From Your Existing HRMS

Replacing your HRMS isn't always necessary to improve HR operations. An intelligent action layer helps your existing systems do more by connecting information with execution.

How AutomationEdge Helps

AutomationEdge helps organizations connect AI, automation, and enterprise workflows. SupportFlo for HR adds an intelligent action layer to existing HR systems to help resolve employee requests and execute HR processes.



Make Your Next HR Process More Efficient

Your HRMS already contains the data your teams need. SupportFlo for HR helps turn that information into action while working with your existing HR technology.
