## RELEASE NOTES: AE VERSION 5.6.0

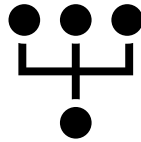

- [AT A GLANCE](#)
- [WHAT'S NEW](#)
- [FIXED ISSUES](#)
- [SECURITY ENHANCEMENTS](#)
- [KNOWN ISSUES](#)
- [CONTACT DETAILS](#)

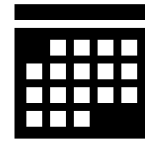

## Release Specifications

Version: 5.6.0

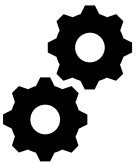

Type: Minor

Date: 15/08/2020

## Release Artifacts

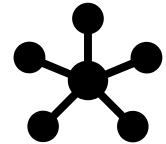

AE Engine  
WAR

AEUI  
WAR

Process Studio\*  
Zip

Integration  
WARS

\* AutomationEdge Server V5.6.0 is compatible only with Process Studio V5.6.0 so updating Process studio is a mandatory step

## Browsers Supported for AEUI

57 & above

80 & above

11

52 & above

# What's New?!

For better understanding a feature, [*GUIDE NAME* | *PAGE NUMBER*] of the current version of guide has been provided after the points (wherever applicable) for the reader to refer to.

## ➤ AutomationEdge Server (Engine & UI):

- Introducing SSO Authentication for AutomationEdge using OAuth and OpenID **[User Guide | 14,49,532]**
- Introducing hardware resource monitoring for Agent machines enabling administrator to optimize the environment **[User Guide | 262]**
- Added ability to restart the Agents directly from AEUI Agents Tab **[User Guide | 259]**
- Added Search bar in Navigation pane in AEUI for enhanced ease of use
- Added 'Go to Top' button to easily navigate the pages with longer contents that needs a lot of scrolling
- Added additional details like Server IP, Database Type, Database URL to AutomationEdge Logs
- Expired Requests are now recorded in Audit Logs
- Added *No Proxy* option while downloading Agents **[User Guide | 265, 503]**
- Multiple other changes in UI based on the user feedback
- Optimized the Agent Upgrade process post AutomationEdge Server upgrade
- In absence of *write* permission for the Agent directory (and/or its folder structure), the Agent will now log the required information and not start unless required permissions are met

## ➤ Process Studio:

- Extending the *Publish Workflow* feature introduced in 5.5.0, developers can now directly update the existing workflows on AutomationEdge Server. Also, the configuration parameters can be set with default values. **[Process Studio Getting Started | 103]**
- Enhanced support on Linux based operating system for all standard Process Studio functions.
- Added the option '*On error execute only error path*' in the Workflow Executor step. This addresses the issue where all paths would get executed if an error occurred in child workflow instead of only executing the error path. **[Plugin Reference Guide 1.7| 245]**

## ○ Integration Component:

- Launching BMC Remedy onDemand (RoD) integration component
- High Availability solution for the Integration service will now work in Active-Passive mode. In case the active node goes down, the passive node will immediately become active and the service will continue to function without any downtime

## Fixed Issues

---

- Users with 'Tenant User' role can now receive Workflow related notifications again
- Fixed the Workflow folder structure issue for AutomationEdge servers deployed on Linux based operating systems
- Addressed navigational issues in AEUI
- Multiple changes in the AEUI to address minor issues
- In case of file upload failure during workflow execution, the agent will retry to upload the file defined number of times instead of directly marking the workflow as failed
- Records for deleted users now get purged according to scheduled purge activity
- Fixed the issue of deadlock condition for MSSQL database users
- Users need not download and register Process Studio again in event of license expiry

## Security Enhancements

---

- Advisory: We recommend upgrading Tomcat 9 to the latest version (or not older than 9.0.35) as security vulnerabilities have been identified in versions 9.0.31 and 9.0.32

## Known Issues / Limitations

---

- The Status of Integration Services is displayed as UNKNOWN intermittently (for few seconds), on AutomationEdge UI, although the Service may be running.
- The *Time Zone* option under the *Polling Schedule* section of Integration > Type Configuration menu is disabled. The default time zone of the machine on which integration service is deployed will be used for Polling schedule
- A redundant update status message is displayed for all existing plugins in PS after the *Plugin Sync* operation if any plugin is assigned to or removed from a tenant.
- Copy Query option in Add/Edit Templates in Reports tab on AEUI does not work for IE browser.
- No email notification is sent when a workflow configuration parameter is removed; even after configuring '*Workflow Create and Update*' notification in Settings menu in AEUI
- An incorrect the email notification – 'Parameter is added' instead of 'Parameter is changed' – is sent when the value of a configuration parameter is changed
- While Downloading Requests from AEUI, Created and Completed dates need to be formatted as 'Date' in Microsoft Excel in the downloaded CSV file
- WebGUI workflows must always be marked as sequential. If one of the WebGUI automation workflows running as non-sequential workflow is terminated, then all the subsequent requests remain in *New* state.
- If admins delete any user who has ownership of a publicly exposed Dashboard, the dashboard does not get deleted as a part of the delete operation. As a result of this, other users get an error if they try to access this dashboard at a later point in time.
- Agents will acquire Tenant level proxy settings (If Any) during upgrades discarding the Agent level proxy settings. The required changes need to be done manually
- Agent restart features in not supported on Linux based OS
- Agent type cannot be changed when the Agent is in *Unknown* state
- SSO authentication is supported only for secure sites (https). In addition, SSO can also be utilized with a domain name – irrespective of secure(https) or insecure(http) site on Google Chrome browser. For example, SSO authentication will not work on <http://192.168.0.1:8080/aeui> but will work on <https://mydomain:8080/aeui> on Chrome.
- Existing workflows will not open if Process Studio Distribution folder path has any special characters.
- SSO authentication is not supported for users with *Sysadmin* role or users who want to use the Process Studio
- Process Studio is not fully supported in Mac i.e. Plugin Sync feature is not supported on Mac.
- Any type of UI Automation (Web/Desktop/Surface) is not supported in Linux based OS
